True, but there is a time I would need it. Lets say I am running Newsie
and want to run Cab. Well When I run Newsie, I have my whole screen
taken up with the various Newsie Windows. I used to have close one to
get to the Jinnee desktop. Now I can just use the ATmenu program. The
same situation arises when I am running Cab (also takes up the whole
screen) and want to access another program. Besides, the Atari fugi
symbol looks great. <g>

I had heard that an Atari version was being worked on, but that was
probably wishful thinking. A port would be nice. I think that only way
to run Netscape on an Atari is to do it through Linux. I heard there
was a Linux version of Netscape.

I have and use Photoline, ImageCopy, Smurf and PhotTip. All work well
to edit various images and all are commercial.

7. Re: Whats 4 bombs mean on my ST?

Newsgroup: comp.sys.atari.st
Date: 2001-06-01 01:20:19 UTC
From: James Alexander <jamesalexander@sprint.ca>
Message-ID: <3B16EDD3.A0AD4901@sprint.ca>
Source record: 45472
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Well I finally got this one fixed up. Turns out the floppy drive had given out. I tried one that still worked and it worked fine. Another minor trouble I discovered was that without the rf sheild the keyboard was shorting out on the 2.5meg ram upgrade board and certain keys wouldn't work. But managed to put an piece of plastic (yes ESD proof) in as an insulator. Now allI gotta do is get my TT working with some external hard drives.

Yes, but not for Linux-68K. But just try Mozilla under Linux on the TT.
After that you will never want to use a browser again, because it is so
painfully slow.

You can do the same with Taskbar/clocky. I can launch any application that is
assigned a shortcut from inside another prog.
Lets say that I'm working with Calamus SL and that I need to find some
info from the Net. I just have to click [control]+[alt]+c (shortcut for
Cab) and there I go.
It's amazing that such a good program like clocky isn't know very well.
It's a multifunctional prg. It can remap the keyboard, it have a
screensaver etc..
Furthermore with Taskbar itself you can always reach your must used dirs
or start another applications. These are very usefull tools and not just a
clone of a MaC thing.

See my other reply. With Taskbar and clocky it's always possible to
start/access programs/dirs from inside another program.

You never replied to the question which asked if you had an accelerator
and/or a SCSI clock fix in your Falcon.

If the answer to the second one is "no", then this would probably be a good
hunting ground - there are fixes published on the 'net.

This message brought to you by the Cheshunt Computer Club - serving the
Atari community since the 1980's.

> iirc the external drive socket is wired in parallel to the internal one!

IIRC That's not true, as I said in a previous message, external drive connector can be wired in parallel like in the first ST (the ones with no internal drive), or it can be connected to select external drive 0 when drive B is selected.
I discovered this some weeks ago when I tried to connect an external drive to my TT.
Just have a look at the ST schematics. (eg. In 1040STe schematics look at sheet 3 on the bottom right corner, look at the solder points W300 and W301 these let you choose between the two drive selection mode).

Regards, Eddy.

25. Fcntl stuff

Newsgroup: comp.sys.atari.st
Date: 2001-06-01 11:43:08 UTC
From: Denis Huguet <deunstg@free.fr>
Message-ID: <3B177FD3.D3029C25@free.fr>
Source record: 45492

Hi there,

I just have a little coding question. I found some docs on the page of SPIN's author and there i found details about some codes for Fcntl to access CDROM... So i made a small test program to read a video file from a VCD (which requires CDROMREADMODE2 to be fully read), but the Fcntl call always returns me an error code stating that this is not available... I tried as well with Magic & Mint, running the respective spin xfs for each system.

Has anyone ever tried to do such a thing ? I'm getting lost...

Hiya

The only cartridge that spring to mind for the ST is the one by Romantic
Robot the 'multiface ST' cartridge. This allows saving and freezing of
software, etc..

But it DOESN'T run on STE's.

If you are interested, i do have one for sale.

They are in parralel, main signals are shared between the drives, only the DS are seperate for each drive. The cause of two drives conflicting is if one drive pulls the lines low when its not active and so the other drive isn't getting the information.

Jinnee has quick keys which is the same but I've never used them for one
reason:

I forgot as I have many programs and so seeing the name of the program to
launch is a help, it would be nice if this was available in Taskbar, bit
like SMU.

Maybe you should try contacting Julian F, the author of Spin (or so I
think).

No that isn't the same. You really must go back to Jinnee before the
quick keys works. With Taskbar/Clocky one doesn't have to top the
desktop at all. Just press the right key combination. This works always
even if the desktop isn't topped.
>

Exactly. Taksbar is a very versatile utility and in combination with
Clocky it forms a killer app. It offers much more possibilities then SMU
or ATmenu. Really I can't get it why a programmer puts its effort in app's
like ATmenu

I can't see how to do this. I don't use Thing and so don't have Thing
groups. Is it possible to use index.grp even with Jinnee so that Taskbar
thinks you have groups? I know the groups won't be seen by Jinne, but if
placed in $home it should be picked up, maybe I should experiment.

I think he means that he wants Taskbar to display the assigned hotkey next
to the apps' names. I'm afraid this isn't practical, as the hotkey-part is
handled by Clocky and Jclocktool, not Taskbar.

Yes, just download the latest (by now pretty old I'm afraid, but I'm
working 10-12 hours a day and don't have much time for my Falcon) beta, a
program called JayGroups is included and will automatically be used by
Taskbar. It adds Thing-like groups to any desktop, including Jinnee.

Hi,

IIRC from the good old days, STE's originally shipped with SIPPS and could
be replaced with simms as a direct replacement.
Obviously the socket would have to be soldered in.

You may also have to find a way of dissabling the burst mode.

Jinnee does a lot of weird stuff to achieve the transparent effect, and
not all VDIs support it fully.

> Eclipse is set up as below

> rage.sys mode 1280*768*8@60 pcibios screencahe imagecahe

Switch off both caches. AFAICR from my experiments last summer, MagiC
doesn't like the screencache. Also, imgcache can cause some problems with
icons. Works perfectly on my MiNT/N.AES/Thing setup though.

> Do I have to set up the nvdifix ? or is it another switch which I have
> missed.

No, "nvdifix" should only be enabled if NVDI is used as a background VDI
(i.e. to support printers only). Normally you would use fVDI as the
background VDI (first run fVDI, then NVDI with disabled screen drivers),
don't enable nvdifix in this case.

> Iam aware that the modern applications from ASH use the new NVDI calls.

Yes, this is indeed a problem. These doesn't seem to work entirely as
intended when another VDI is used to access the screen, I had some related
problems with Nova VDI as well. I don't know any good solution for this,
except from not using these apps :-(Some apps will only use these calls
when available though, so running without NVDI will often help. I haven't
used NVDI in months and enjoy the speed and stability offered by fVDI
alone.

Hi,

Perhaps you should go and talk to a company called A1 music in the UK, they sell good stuff but when I went in and asked about my machine performing for Midi I was told my system would barley run a Word Processor!!!!!

Now I know it's not THAT fast but come on a P2 350 (running at 466 for 3 months 24/7) with 398Mb ram!!!
about 10 years ago they were trying their best to sell 512k or 1mb STFM's!

As far as I am concerned ,I am with you but my Atari still has a place. It can still perform many tasks easier than my PC can and after using a PC for 9 years and being a system admin that's got to be a shame that Sam Tramiel can't read this and be proud.

I love my PC and my Atari. The only problem is that both do very well on one thing MIDI.

> like ATmenu

I use Magic (as well as Geneva and AES 4.1), but I do not have Jinnee. When
I put Taskbar in the START folder, it won't automatically start because it
doesn't see that the AV Server exists. SMU and APPLINE is an OK workaround
for this, until you cover them with windows from other programs. This is one
good purpose for ATmenu. It's always there, especially for those of us who
can't get Taskbar autostarted.

*** Other good uses ***

- Quicker access to CPX's

- It gives me an alternative to Magic's stupidly short ACC list. Why
they only put 6 slots (a la old GEM style) is beyond me. I've been told it's
for compatibility and that Magic has no need for so many accessories, but
that's gotta be total BS. Geneva is more compatible that Magic will ever be,
and uses as many ACC's as you have memory for. And even with Magic, there
are times when I need to have more than 6 ACC's running. With ATmenu, I can
put in ACC's (renamed to APP) that don't necessarily need to be constantly
running, but that I want right up there for easy access, and the ones that
do need to be running I can keep in Magic's ACC list. Although I really wish
they would fix this stupid problem...

- The ability to just drop a program or alias into the folder and it's instantly available, without having to run setup programs or quit and restart the menu.

*** Things I would like to see changed in ATmenu ***

- Have it make a list of the files in the directory upon bootup, so it doesn't have to load all the names every time, and only check for the number of files and/or the combined file size of the directory to know when to update the list, thereby making it faster.

- Have an editable mask function that will only display files with certain extensions (like *.PRG and *.APP), and then have it remove the extensions when displaying the files, so you only see the names.

- Have an "alias" file that can be put into the folder that has lines like:

"Papyrus Office" = D:/PAPYRUS/PAPYRUSO.APP

And then just lists Papyrus Office in the menu, instead of PAPYRUSO.APP. This would also solve problems with programs that look for their RSC's in the same folder they're run from. I did try the alias thing, and it still looks for RSC's in the ATMENU folder on my system.

I'm personally glad to see this program. Even though for some it seems useless, there might be those that would prefer things this way instead. Maybe someone doesn't like having to go to the bottom of the screen to get programs, and would rather have everything up in the menu bar? It's all a matter of having more options and choices rather than saying that because it can already be done another way, the program shouldn't exist. That's my opinion, anyway.

Use JAY Groups for this. It is Thing-group-compatible, and a pretty nice
program in its own right.

Hi,

I don't really want to drag myself into this but ENOUGH!!!!!!!!!!!!!

I had my STe uprgraded by Dave many times, Memory, switchable Tos, High density upgrade etc, and so if Dave says that Barrie is a reputable dealer then I shall use Barrie.

I have used barrie since I have had a Falon and he perormed the memory upgrade perfectly and answered my questions fine. I am a hardware/software engineer as well asbeing a system admin for my company and questions that I ask mean a lot to me as they specify how much somebody knows and thus I can smell it a mile away.
I did not get this impressiion from Barrie, he seemed professional, he knew what I was asking and gave good advice/answers!

This is a good dealer as far as I am concerned.

When Dave was servicing Atari's we could book an appointment with him and have the machine back within the hour, as long as the fault was a biggie adn I can do the same with barrie except he will answer questions while he is doing the work.

All I have left to say on the matter is that Dave and a few other people who in my younger years were people that I aspired to be. I left the Atari scene when I got my first Intel box, Now I have become a computer system engineer I can afford to get back into the scene and hopefully help out where I can. BARRIE, keep up the good work and let it be known that people DO appreaciate your efforts!!!

Anyway.

Goodbye for now

Tim Anderson

the 520stfm has 720kb internal drive, but maybe it's not the same in all
countries?
the older 520 ST had an external 36kb drive SF354

>either they have Single TOS, lower specs machine etc.. ATmenu works like
>ACC, use own inf file so it is OS independant...

I'm not so sure ATmenu runs in singleTOS.
The docs says this:

* Multitaskingfï¿½higes Betriebssystem (d.h. AtMenu lï¿½uft nicht unter
Single TOS)
* NVDI 5. Getestet wurde unter Version 5.03 (Ein Freshup von NVDI kann
gratis unter http://www.nvdi.de downgeloaded werden).
* Desktop, der das AV-Protokoll untersï¿½tzt (getestet mit Jinnee)
* Auflï¿½sung von mind 640 x 400 Pixel

It do need a multitasking system. The docs explicite says that ATmenu
doesn't work under SingleTOS.
It even needs NVDI more or the less. Without NVDI it looks really awful.

>I use Falcon, TT and ST
>equaly, i dont wana put owners of NON hades, non ACCelerated Falcons etc
>aside.. Im glad ppl does anything, if i have better solution or dislike
>the app, i still cheersih the will and effort

Nor do I. I'm glad that some guys still writes program for our platform
only I can't get it why we needs just another application launcher. I
think the effort should better go to apps we really needs such as a modern
browser

Just add a line like this in your gem.cnf (/geneva)
run H:\taskbar\taskbar.prg
and you'll see that Taskbar comes up nice and smoothly.

>- Quicker access to CPX's

With Taskbar (yes again) you've directly access to the CPX's. Another
possibility is the Freedom 2.05 fileselector.
>
>- It gives me an alternative to Magic's stupidly short ACC list. Why

You can get around this when you use Xboot. You can get as many as you
like. Don't know if this work with MagiC though but it surely works with
MiNT

>- The ability to just drop a program or alias into the folder and it's

Right now it's painfully slow.

Like I said earlier with Taskbar/Clocky one can launch prog by means of
shortcuts even it the desktop isn't topped. The only drawback is that
one have to remember the shortcuts.

>matter of having more options and choices rather than saying that because it
>can already be done another way, the program shouldn't exist. That's my

Oke, oke I have put it too strong. My opinion is still that we don't
need urgently a yet another application launcher but applications like
an up-to-date browser.

Thanks Jo, I had an old version 2.70 and there was no docs. I never saw a version 3 alpha (until today) as the front page to your website (the one at nvg I think) is displayed as just two images. (I browse with no pictures). Maybe if I turned the images on I would have got further but a search at google directed me to the beta taskbar and not the alpha version. I remember hearing about Jaygroups in AC come to think about it, but I never took any of it in really as back then I was on an STE with TOS 2.06 :)

Hi there,
Some more issues that I have. I've tried TOS, Geneva, MagiC and
MiNT. They all work differently. I can't get a desktop to load in Geneva
using Eclipse. TOS is fine but most of the time quitting programs will crash
the system. MagiC without Jinnee seems to be allright. Jinnee hates Eclipse
because you can't scroll or move windows without crashing. Thing won't work
in 1024x768. MiNT seems to be OK. I'm using N_AES 2 as an aes and Thing as a
desktop but once again I'll have to run lower than 1024x768. If I don't put
4mb on the rage.sys line the screen flickers on one side and there's a lot
of garble on the screen. Any help will be greatly appreciated.

Joshua.

I am not a fan of these shortcut keypresses mainly because I cannot
remember them all. Still, to each his/her own. That is why there are
many programs out there.

>looks for RSC's in the ATMENU folder on my system.

Yes, that would dress things up alittle..

I would get Jinnee. It makes using this program much easier. I have
created links to the programs I want listed and also to all of my
partitions.

I would like to see a bigger choice in the colors.

Hello all,

Here is a link to an article I wrote for Good Deal Games concering the ue of 800XLDJ. This program is to Atari computers what APE is to the PC. It emulates an 8-bit disk drive and lets one run programs on an 8-bit using the bigger Atari computer's disk drive. All the shots of the program were captured using ImageCopy. All the screenshot of the program, my Hades system, the SIO2ST cable, the 130XE and the VGA-801 were taken by my Sony digital camera. I thought GDG would announced it by now. Since they have not, I am....

them
> by private email. In fact, I've emailed you (Dave) anyway.
Yep i got the email. Once again quite opinionated.
It dosen't matter how much you protest, the fact's remain that your two
small

groups contain the only people who have been abusive to Barrie in csast.
All i was asking was it your groups opinion or yours? Once again quite reasonable.

BTW. Instead of using private email feel free to post your views to the group.
I will answer for my postings and views here and not behind closed doors as you would wish. Don't post to my email address again unless you want some back. Lets have a public / open discussion.

> Abusive replies will be ignored.

Tough. If your members are abusive to others then as an associate expect it back.

Utter contempt

Dave

The external drive connector is in parallel with the internal one. The
difference
is the drive select lines. The ste and stfm are different on the assignment
of the
signals. I can't remember the exact pin out at the moment but it meant that
some external drives that were made for the STFM didn't work on the STE
as a conflict would occur once plugged in. The remedy for this was to change
the drive select signal on the 14 way connector from one to the other. As i
say it
was many years ago but the biggest culprit for this problem was the power
computing
ones.

Only on the Macintosh side of Gemulator. If you plan on running ANYTHING that might break that slightest TOS/GEM rule, don't use Gemulator. Steem is the most stable emulator I've used.

The ST Emulator part of Gemulator emulates a standard 68000 CPU.

76. FS: MEGA ST 2

Source record: 45442

Hi everybody,

I've got a MEGA ST 2 with TOS 1.02 for sale. It comes with the power cord and a keyboard (unfortunately no mouse). Works great, just used it a few minutes ago. I'm selling it because I've got a 1040 STE on the way. I'll ship to the US and Canada.

$150 or B/O
(feel free to make an offer! price is flexible! no lowballers)

Thanks,
Matt

Taskbar works fine in Geneva. I meant that this happens while using Magic.

>> - Quicker access to CPX's
>
> With Taskbar (yes again) you've directly access to the CPX's. Another
> possibility is the Freedom 2.05 fileselector.

True. But this adds another possibility if you can't run Taskbar from
startup, like I said in the post before, and is a *little* quicker and
easier than calling up Freedom or other Control Panel.

>> - It gives me an alternative to Magic's stupidly short ACC list. Why
>> they only put 6 slots (a la old GEM style) is beyond me.
>
> You can get around this when you use Xboot. You can get as many as you
> like. Don't know if this work with MagiC though but it surely works with
> MiNT

Again, this is only a Magic issue. Magic will not allow more than 6 ACC
programs to run, as there are only 6 ACC slots, just like with old
single-tasking GEM. Geneva and AES 4.1 (probably NAES as well) don't have
this limitation. It has nothing to do with X Boot or any other boot manager.

>> *** Things I would like to see changed in ATmenu ***
>>

>
> Right now it's painfully slow.

It's bearable if you only have Control Panels and a few programs in the
ATMENU folder in the menu. But more than that and you might as well go for a

walk while you wait for it to show up on the screen.

>> I'm personally glad to see this program. Even though for some it seems

This isn't good for paople who are very visually oriented and can't remember
a bunch of key combinations (like me :)). Also not good if you can't get
Taskbar to startup.

>> matter of having more options and choices rather than saying that because it
>> can already be done another way, the program shouldn't exist. That's my

True that we need good browser. But if this person's not quite up to that
challenge, then this is a good alternate. I personally find it useful.
Besides, a full-blown, up-to-date browser's not realistically something
we're going to get out of a competition like this, unless the competition
lasts a few years before the entries are due. We're going to get smaller
programs like this one, and hopefully they will be of use to someone.

Hi Mike,
I think this is a key point. The competition itself was (relatively) not very long, and the prizes were (relatively) not very much in comparision to how much work an application such as a Web Browser would require. Perhaps in the next contest, we will approach it in a similar manner that Lonny Pursell did with his "GFA Challenge."

(Look at: http://www.bright.net/~atari/html/gfa_gem.htm)

That is, to ask for small "pledges" from users.... Nothing motivates more then pure hard cash...

As long as you look out for software that specifies it should not be used in TTRam, just about everything is good to go in it. It's been a long time since I learnt the details, but IIRC NVDI for graphics cards should not run in TTRam (is that right?) and I think there was something about DMA sound.

Can anyone else confirm this?

I think that would be an "interesting" summer project. Seems moderately
difficult for a soldering spud like me. It's just a pity that the diagrammes
are quite "dirty". And where is the parts list? Has anyone got that worked out
so that I might go and order the necessary parts?
In particular, the ISA connector seems like something you're not about to find
in a solderable kind very easily. Extracting one from a PC motherboard doesn't
work, the connectors just fall out of the plastic holder. Is there any card-
edge ISA connector available?

I've been trying to reply to your emails, but there seems to be something
wrong with your address since I'm getting 'permanent delivery error'.

Anyway, the most important part of what I was trying to say in those letters
was that the behaviour you mention regarding '4mb' is impossible if you
have the PCI BIOS installed and working properly (since fVDI will then
auto-detect the amount of memory and not consider that flag at all).
A non-working or non-installed PCI BIOS could very well cause several of
the other problems you've mentioned too.

So, make sure you have installed the PCI BIOS. If that by itself doesn't
help, try to see what it displays at startup (there should be a few lines
with some numbers) and send that to me (you can pause the bootup text output
using ctrl-S). Needless to say, the bootup text will only be visible on a
monitor connected to the normal Atari VGA connector.

I think my ISP is blocking too many domains from sending email. Can you try lord_gaiyan@hotmail.com? Thanks. I'm at work now so I'll try get those numbers later tonight. As weird as it sounds, even if I have 'pcibios' on the rage.sys line the flickering and garble stops as soon as I put in the 4mb. PCIBIOS is installed and does give a bunch of numbers. I'll try to replace it. Is the PCIBIOS same through all the versions? The beta folder didn't seem to have it. One more question: I have an RGB monitor connected to the Falcon so it's really easy to see the output on both monitors without any unplugging. Can it cause problems being an RGB monitor? I tried without it and didn't make a difference. Thanks.

Joshua.

I wonder what it would take to get someone to adapt it to some other card
which isn't as messy as the NE(1|2)000. Such as the SMC cards, those are very
nice indeed. I doubt that 3Com ones would work.

The Mac doesn't have all those odd file names, nor does the Amiga. In fact,
the Mac doesn't even seem to have linked libraries, though some people tell me
it does.
Besides, what are you griping about? Can't I say what it should not have? IMO
that is just as important.

>
>> Currently eclipse is in use with NVDI as a background VDI. on my F30

As Jo Even mention later, it does not seem like you have NVDI in the
background, but rather in the foreground. That is the only way to make
use of NVDI for screen output.

>> When used with Jinnee 2.5 it is stable until I try to copy a file. At that
>> point the computer just hangs with the hand icon still moveable. the file

I can't say I've ever tried copying files when I've tested Jinnee, but I'll
take a look. I don't know if I have the 2.5 demo, but if there is one I'll
download it.

>Jinnee does a lot of weird stuff to achieve the transparent effect, and

You don't say!

When I first tried it, that transperency wasn't even close to working under
fVDI, but I thought I'd got it under control now. I know it worked fine with
at least one version of Jinnee.

>> Eclipse is set up as below
>
>> rage.sys mode 1280*768*8@60 pcibios screencahe imagecahe

60Hz? Ouch!

>Switch off both caches. AFAICR from my experiments last summer, MagiC
>doesn't like the screencache. Also, imgcache can cause some problems with

It likely won't help to disable 'screencache' under MagiC, since the AES
background buffer caching will still be active. The easiest way to disable
that is to not let the ACC run (it can also be done from inside the ACC
using the new option entering functionality (IIRC, something like 'aesbuf 0'
should do the trick).

>icons. Works perfectly on my MiNT/N.AES/Thing setup though.

Yes, the icon caching relies on applications always using the same memory
block for the icon graphics and not reusing it for anything else (fVDI
replaces part of the data with a magic number to be able to recognize an
icon that has been cached). For most applications this is fine, but some
are bound to do strange things.

>> Do I have to set up the nvdifix ? or is it another switch which I have
>> missed.
>
>No, "nvdifix" should only be enabled if NVDI is used as a background VDI
>(i.e. to support printers only). Normally you would use fVDI as the

Exactly. It is needed since NVDI would otherwise try to move itself forward
in the Trap#2 chain when a printer device is opened. It would then end up
before fVDI and be terribly confused when other VDI calls arrive for handles
it doesn't know about.

>background VDI (first run fVDI, then NVDI with disabled screen drivers),
>*don't* enable nvdifix in this case.

Since 'nvdifix' is only checked when fVDI is installed, I don't think it
would really do any harm even without NVDI already loaded. I have never
tested this, though, and there is no reason to have it enabled in such
a setup.

>> Iam aware that the modern applications from ASH use the new NVDI calls.
>
>Yes, this is indeed a problem. These doesn't seem to work entirely as
>intended when another VDI is used to access the screen, I had some related

In part this is because NVDI doesn't think a background VDI knows about
these commands. For example, the new call to set the background colour
for text isn't passed through to the underlying VDI, which thus has no
chance of knowing that it has been called. This has the funny effect that
one of the NVDI 'demo programs' works mostly fine when fVDI is used on its
own, but will draw text with the usual white background if NVDI is on top.

>problems with Nova VDI as well. I don't know any good solution for this,
>except from not using these apps :-(Some apps will only use these calls
>when available though, so running without NVDI will often help. I haven't

Most of the new features can be checked for in various ways, but some
programs seem to check only for specific NVDI versions...

>used NVDI in months and enjoy the speed and stability offered by fVDI
>alone.

Not according to my (and my friends') experiences. When I had a power outage,
the Linux system fell into a never-ending spiral of fsucking (and requests for
me to manually log in and fsuck the system) whereas the NetBSD 1.1 system just
came back up.

Yes, it seems so..

> Nor do I. I'm glad that some guys still writes program for our platform
> only I can't get it why we needs just another application launcher. I
> think the effort should better go to apps we really needs such as a modern
> browser

Well i wont deny that, but u see, coders who arent able to do browser or
other big project (which would require a team) or they started coding etc,
they do smaller things, and those things helps to learn coding, to use
AV_SERVER, etc, etc, etc.. If they release them, even better..

I wont disagree that we need a browser, altough my views on new are a bit
unconventional (years ago we need to transfer 10kb of txt (txt = info),
later we need to transfer 10kb of info, a lot more kb of usualy useless
pics and banners, and nowadays and in future we had to transfer 10kb of
same info, 100kb of some stupid applet to be able to read it , banners,
and so on..) so i dont think we realy NEED such browsers.. As we now
exchange opinions here we dont need java applets, animated icons, etc...
And we understand perfectly :)

>the rage.sys line the flickering and garble stops as soon as I put in the
>4mb. PCIBIOS is installed and does give a bunch of numbers. I'll try to

If 'pcibios' is active and fVDI finds a _PCI cookie (which the PCI BIOS
installs), the memory size selected by '4mb' is disregarded.

Having the wrong memory size selected will give exactly the kind of
problem you describe here.

>replace it. Is the PCIBIOS same through all the versions? The beta folder

Well, it has been updated once or twice, but it was a long time since that
last happened. The file is supposed to be 14066 bytes.

If you have some way to check for installed cookies, search for _PCI.

In case there's something wrong with the cookie install code in the
PCI BIOS, try disabling some other AUTO folder programs you might have.

>didn't seem to have it. One more question: I have an RGB monitor connected

>any unplugging. Can it cause problems being an RGB monitor? I tried without
>it and didn't make a difference. Thanks.

There should be no problem with that. If possible, it's a good idea to have
such a setup when trying to figure out what's going on with fVDI.

Hi Diedrich,

>But full colours works only up to 600 * 300 dpi, Beste-600 dpi is
>only in grey. PhotoREt (2400*1200) is not available.
So the bottomline is that the new HP printers can't do photo quality when used with the NVDI printerdrivers? Then these printers are not really an option if NVDI isn't updated (anymore). If 600*300 is the best one can get from these printers, one could just as well buy a second hand model, which is supported by NVDI and lots of custom printerdrivers.

Cheers from Belgium

DMA sound players should not be put in TT ram, IIRC from the Nedplayer docs. The DMA chip can't access TT ram and so this is why you need ST RAM when using the Atari Laser (which is driven by the DMA port).

Hand drawn mate! I find drawing on sheets asier than using graphics
programs. Or the fact that there is a lack of schematics drawing programs.

>And where is the parts list? Has anyone got that worked out
>so that I might go and order the necessary parts?

Parts are all on the sheet IIRC.

>edge ISA connector available?

Right, use a 0.1" pitch edge conector tha is 2*26 way. The MSB are not
needed (as it's 8bit only) so you only need half the connector.

Stik2 doesn't offer plug in bits like drivers (AFAIK) and iConnect, well,
never tried it. But from what I've seen it seemed like it couldn't have
extra drivers too. I'm not sure TBH. The majority of users are Sting and
Mintnet, Sting drivers just need a change in the asm and Mintnet needs
someone who knows how to do Mintnet!

I have his email in the txt file.

112. Papyrus and Unicodes

Newsgroup: comp.sys.atari.st
Date: 2001-06-02 11:21:28 UTC
From: vdjole@EUnet.yu
Message-ID: <9fai7m$n0m$2@news.eunet.yu>
Source record: 45381

I received a MS-Word document which contained text composed of unicode characters, mostly, (but not exclusively) corresponding to MS code-page 1251 (Cyrillic). I tried to load it into Papyrus (demo) 8.23, but all characters except punctuation marks were shown as blanks. Papyrus was set in Options-compatibility to treat characters as Unicodes, but it did not help. Changing RTF-import encoding to code-page 1251 or anything else did not help either.

Btw. there is NVDI4.11 loaded on the machine and the font is a Truetype Arial which surely contains the cyrillic characters.

Looking at the intermediate .RTF file which the Papyrus convertor module produced, I saw that, for example, cyrillic characters "ABC" were encoded as \u1040 \u1041 \1042, which Papyrus did not display.

When I tried to write the same characters in Papyrus, by clicking at cyrillic characters in the "Character set", and saved that as a .RTF file, I found that Papyrus coded "ABC" as \'c0 \'c1 \'c2 and declared code-page 1251 in the header. Obviously the characters were mapped into 8-bit space.

Is there a way to make Papyrus read the complete range of unicodes?

cu.

Hmmm...
I used a PII450/256MB RAM as my first music-PC, without ANY problems whatsoever - so they apparently don't know what they're talking about... ;)
The only problem you might run into would be if you use a poor soundcard and run the midi through it - instead of using a dedicated midi card or an external USB midi interface.

> As far as I am concerned ,I am with you but my Atari still has a place. It

Atari should absolutely be proud of their great products, since they're still good enough for many people after so long time. I've made major upgrades of my PC 3 times during the last two years, to keep up to the speed and make sure I don't loose too much money when I sell the "old" stuff. A computer that's still actively used 10 years after it's creation is nothing but impressive and it'll never happen in the PC- or Mac-world, but still my PC performs better than any of all my Ataris have done - and I used to be a die-hard Atarian for years and years... I'm still a member of the swedish Atari club and I still frequent the NAS - both as a retailer and as a seminar speaker - so even though my own Atari usage is kept to a minimum these days, I still try to help people who want to continue using their machines - and people who get their hands on second-hand machines for next to nothing.

> I love my PC and my Atari. The only problem is that both do very well on
one
> thing MIDI.

They absolutely do (even though the PC can perform better due to the better external hardware that's available) - but if you want to record audio too, you need a Falcon with CAF - or a PC with VST and a good enough soundcard,

and there's no discussion about which one is better - even though the Falcon
is good enough for many users, the PC's processing power makes it MUCH
better, with more available audio tracks at the same time - and plugin
effects, software synths etc...

I think this is mentioned in the docs (if not it should be added): Taskbar
can start before the AV-server, if it can't find any it waits a second
and look again. It repeat this five times, which usually is enough but
might be to little if the desktop use a long time to initialize. I'll
change this in the next version, available sometime in my lifetime.

Personally I prefer to let the desktop autostart Taskbar, and let Taskbar
autostart everything else.

This isn't handled by Taskbar. But if Clocky is present you can use a
hotkey (user defined) to open Taskbar's start-menu and select the app from
there.

From: "Tim Anderson"
Message-ID: <9fapscdpj1@newsg3.svr.pol.co.uk>
Source record: 45388

Hi

I think you are of the same understanding that I was until I emailed them.
Thi is what I received back from them:-

We don't plan any hardware improvements since Gemulator was pretty much
feature complete 5 years ago. The only hardware we don't emulate at this
time is the ST's MIDI ports and we have no plans to implement those.

Now as far as TT and 68030 support, there is a difference between asking for
TT emulation and 68030 emuation. One involves enhancing the hardware
emulation, one the CPU emulation. 68030 support we added to Gemulator about
3 years ago. You can boot up TOS 2.06 in 68030 mode and it'll work great,
and '030 optimized programs like Calamus SL will execute 68030 specific code
paths for faster performance. Again, that's all been up and running for 3
years when we shipped the Gemulator Pro product. You have to remember most
people use a TT or Falcon merely as a fast Atari ST, just as PC users will
upgrade from a Pentium II to Pentium III for faster performance, not because
a Pentium III has new features. I know of very few Atari software titles
that _require_ a TT, and for those it's not worth months of development work
given that Gemulator is a free product after all.

I didn't see the 030 Atari emulation mentioned on their website though

It turns out that I had indeed already made this possible. The reason I
couldn't find the code in question was that it was in the ACC rather than
in the fVDI engine itself.

An exclamation mark ('!') in fron of an option causes it to be passed to
the current screen driver rather than the fVDI engine. That is, to turn
off 'imgcache' enter
!-imgcache
and to turn it back on
!imgcache

Hi All,

I have an offer for a serious collecter of Atari memorabilia that
will appreceiate these two (2) items. I am looking for a home
for 2 brochures. One is a brochre for a 1040STe, while the other
features a MSTE. Both are 8 1/2 inches wide by 11 inches they are
in full color with a pop up monitor that pops up when the brochure
is opened. Kinda' hard to explain but if you ask by e-mail I'll
send by attachement to e-mail two seperate JPG's, one pic closed
front cover a second opened up showing the popup. These are NOT
FOR SALE just a good home.

GEM structured? Now that was funny!

I think it is a mess (and I say that as someone who was written a complete
VDI and parts of an AES besides some GUI programs). While some thinking
was obviously put into parts of it, it is very limited and in the case of
the VDI (which is what I have the most experience with) badly suited for
high performance implementation.

>>Funny, but last time I checked, GEM did not network.
>
>It most certainly doesn't, and that is just about the only strength X has.
>It's a rudimentary network GUI, not something you run 24/7 on your local

X is not a GUI at all, really.
It is, as you say, rather rudimentary. This is in much the same way as a
microkernel (which you seemed to like), though. It provides powerful
mechanisms you can use to build graphical user interfaces.

>>> >> Linux?
>
>>rather, why not?
>>it is widely supported, it is multi-platform, free and is opensource. What
>>other OS can fit that?
>
>Why would any other OS care to fit that?

I guess the OS wouldn't care (;-), but its users should.

I doubt you disagree that support is good.
How likely is it that you'll be running TOS or Amiga OS natively on
whatever your main computer is ten years from now? How about Linux?
Would you rather pay for an OS or have it for free?
In what way do you think open source is bad? Surely it must be better if
the users can fix problems when they are discovered rather than having to
wait for a corporation to decide to do a new release (which you might well
have to pay for), for example?

>Besides, you definition of "wide support" is rather odd. Would you call Be or
>AmigaOS widely supported as well?

While there is certainly more support available for the MS OSes, Linux
probably comes in second. _Very_ far ahead of BeOS or AmigaOS, not to
mention TOS.

Just to put the record straight, I have within my reach right now machines
that can run (as in have installed) TOS/MiNT, Win98, Win2000, Linux, BeOS,
Solaris, MacOS, AmigaOS, QDOS, EPOC and a few other minor ones, so I'm not
terribly biased.

Are you saying that Taskbar can't be launched automatically from
the start dir? Euch, I just did a quick test with Taskbar and
MagiCMac. Taskbar comes up nice and smoothly. At that point no
problem.

That's for sure but still I can't get why Taskbar won't run from
startup. It surely starts up on my G3.

Right you are. I was misleaded by the fact one can take away the 6
slot limitations with Xboot. Indeed I could load 8 acc without any
problem using N_AES (without X-boot).

Taskbar should come up whatever OS you use. Anyway one only have
to remenber one letter/figure and if one choose the letter
logically it shouldn't be that hard to remember. But yes you're
right working with a popupmenu is in most cases more comfortable
but not so fast as working with shortcuts.

>exchange opinions here we dont need java applets, animated icons, etc...
>And we understand perfectly :)

Yes, we do understand (besides some language problems now and then) each
other perfectly. The reallity is however that more and more
pseudo-webdesigners make use of Java, Java script, flash etc.. making it
impossible to get on these page using Cab. Even some Atari pages are
inaccessible nowadays.
Heck I don't want a browser capable to read java scripts, Java, Flash,
etc... I would be more then happy if I had a browser which understands
HTML4 and CSS correctly.

Yes and no. I do have long term experience with TOS but MacOS was
completely new to me and I only have little experience with Windows.
So far I haven't found any joy with MacOS. I merely use the Mac. I've
bought the Mac because I wanted to use cable net on the Hades. As you
probably know this is for the moment still impossible due the lack of a
DHCP client (MiNT-net or STing). AFAIK the only way to get on the cable
with an Atari is by means of a pc/Mac that acts as a gateway. That's why
I bought me the G3. Right now it serve mainly as gateway and as game
machine for my son. From time to time I use a Mac browser to visite
pages which are out of reach of Cab. Apart from the browser I use
sometimes bbedit pro to work on the webpages of a local aquarist club
but that about all. I do most of the work (95%) on the Hades.

>OTOH, there doesn't /seem/ (one never knows for certain on the Mac) to be as
>many files shuffled around on the Mac as in Windows.

Luckely not. The worst case is that some files are invisible making it
sometimes hard to remove not used progams.

125. Vectore fonts & Eclipse

Newsgroup: comp.sys.atari.st
Date: 2001-06-02 16:46:53 UTC
From: osian@zetnet.co.uk
Message-ID: <3b19187d$0$7282@news.zetnet.co.uk>
Source record: 45296

In the spate of current posts about new owners of Eclipse, I get the impression that it's quite common, and indeed desirable, not to use NVDI in conjunction with fVDI.

So if that's the case, what do people use for vector fonts? And printer drivers?

I found out why from another post. If the AV Server takes too long to start
up (i.e. the desktop takes too long to initialize), then Taskbar stops
looking after a while, complains of there being no AV Server, and quits.
I'll have to see what I can do about this. I think I have too many programs
in my START folder, which all seem to have to start up before the desktop is
run. I'll try changing that and see what happens.

I drop NVDI simply because I don't need either vector fonts or printer drivers (in fact, I don't even own a printer these days). If you want/need either you can happily use NVDI, although this will slow down things slightly.

I believe DHCP for MiNT-Net is now being tested. Atleast I read an
announcement somewhere that said this.

Looks like we both want the same thing. The only reason I have a 486 is
for Acrobat reader and going to that odd Java/Flash site.

>Heck I don't want a browser capable to read java scripts, Java, Flash,
>etc... I would be more then happy if I had a browser which understands
>HTML4 and CSS correctly.

Flash no, but Java can be useful and is used in quite a few sites these
days. Usually what annoys me though is the fact that it doesn't have to
be used. Sometimes it's used to bring up a new window and display another
website. I've seen CAB do this with some HTML sites so I know the site
doesn't have to use Java. Secure browsing would be idea as well. I have
no doubt that if the cource code to CAB could be got it would not take too
long for a good coder to add these features but I doubt he's gonna let it
go.

Yeah, I need the vector fonts for word processing and web browsing,
and obviously need the printer drivers too.

Hmmm....

Wouldn't it be nice if fVDI could develop to be a font engine too?
And to be able to use NVDI printer drivers.

I have put my collection of Atari ST Informer magazines up for auction on eBay. It's a 3-day auction with no reserve and a low starting bid. This is a great opportunity to get some of the best Atari ST related reading out there. Would also be great for someone making an online archive of Atari ST writings. Check the link below to see the auction:

135. Matrix Keyboard Tunesmith Instruments

Newsgroup: comp.sys.atari.st
Date: 2001-06-02 20:40:04 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0106021240.2c35dee5@posting.google.com>
Source record: 45308

Hello All

Here is a post from Atari-Midi about a new way of working with Jim Johnsons program TUNESMITH. See my Tunesmith page on my site..(see sig)You can download Tunesmith from there. There are two versions available which includes a 030 compatable version.

Tim

Rather excited as I have been working on perfecting my "matrix Keyboard Tunesmith Instrument"

Basically it allows you to actually PLAY the computer keyboard as a controller. You can assign whatever note you want to each key. I just created a Tunesmith TUN file that has a chromatic scale programmed as well as a Midi file demonstrating it. The link is here:

http://groups.yahoo.com/group/atari-midi/files/AOTM/may01.tunesmith/Matrix/

The CHROMET.MID is a LIVE performance of me "pounding"..er..Tapping..on the computer keyboard. Tunesmith provides the rythms. You can have mutiple rymthms by adjusting the DIVIDE and RHYTHM parameters within Tunesmith. I created a few presets to work with as well.

This is a rather exciting concept, as it allows you to go beyond what the program was designed for. Its a lot of fun to play .

I have also created a library of indevidual scales for each note so anyone can create thier own Matrix keyboard Tunesmith Instruments. It would be great if members here could create thier own "Instruments". In the meantime, experiment with this file. Its great fun!Bet you never knew you could actually PLAY YOUR ST!!!!

here is the backgrd for the idea from my Tunesmith page:

The idea for this came from an alternate "keyboard" I used to own by EML called the matrix keybrd. It was basically a matrix of pads arranged 4x4=16 keys, with indevidual knobs for tuning each pad. I created my own scales. Thru time, I lost that keybrd. However, I am able to reproduce it somewhat with this file! Since each QWERTY key in Tunesmith can be assigned a scale, I assigned only ONE NOTE across the scale, so each key on the QWERTY keybrd is actually one note.

Then I created a "scale"across the QWERTY keys. So when you Select START in Tunesmith, you can "play" the QWERTY keys like a keybrd controller. The only thing is it is rythm dependent on Tunesmith's tempo.But it is Unique. A way to go beyond a softwares intention!

Tim

Problem in my eyes is same as with lynx text browser, ppl just dont
wana add simple ALT tag to pics, or simple normal html link to main parts
or atleast brief info about main things.. For me that is unpolite and
generaly bad.. We all speak english in here, so we do compromises so we
ALL understand.. ANY good page should be done in a way that all can watch
it, even if its limited. And same as i ignore bad person i do bad pages,

Why not using Speedo GDOS then?

Indeed it's unpolite and generaly bad but try to tell this to the
pseudo-web designers. Good luck.:-) This is the same problem as
HTML in mails. People doesn't take in account anymore that not
everyone is using the same mailer.
Both things go against the Net policy which says that the Net must
be accessable for everyone regardless the OS/Browser one is using.
Nowadays lots of pages are only make for a certain browser or
even for pc only. Mac users who wants to visite pages which holds
ActiveX will find out that it's impossible even if they use MIE.

>We all speak english in here, so we do compromises so we

>frames or non frames and on text browsers.. no big deal

Indeed not a big deal. But howmany web designer are knowing what
they are doing? Nowadays it's for everyone very easy to create
page. One haven't to learn HTML anymore. All things are done with
the so-called web editors. Oh boy most of them produces very bad
code. Link this to a designer who knows nothing about HTML and you
will get a very nice page, only viewable on their own system.

Hello,

Currently I doing some work on the UTSI. I've correct already lots of
non-working links but there are still many left.
I wonder if someone knows where the L.A.P.D. collection is located.
The link I have is dead: http://www.lapd.demon.co.uk/dload.htm

TIA,
Martin

> answer, the past is history,
I don't claim what you imply (is it just another way of you trying
to be superior and put people down).
As you say the "past is history" so what crusade have YOU been
on all these months?

> what is important is the future... tell
> me I'm stupid: but where do you fit in?
I will gladly go back to reading the group and posting occasionally in a
polite manner as i have over the years. Just as long as you and your
group do the same.
You and your group members started all the abuse and dragged others in.
sweet's postings implied wrong doings based upon a story spread by lai.
Unfortunatley for sweet, lai had already retracted it in private email.
However, sweet still used it in his postings and i simply responded only
with the same level of abuse that you and your group had dished out.

> >BTW has Lai posted recently?
> Is your newsreader playing up again?
Just asking him to tell the group the original story that he spread. I can't
understand why he wont tell the group. Or is it because he dosen't like to
admit that sometimes we get it wrong when we look at both sides of
a story?

How would you like someone to start attacking your character in
public? Would you fight back or hide behind your keyboard?

sweet is the one with a problem. We can all tell what he implies
but he is too spineless to go any further and be proved wrong.

Just face it Dennis, sweet has _used_ you as a mouth piece so don't
be surprised when you get told to sod off on the grounds that
you haven't got a clue.

|help either.
|
|Btw. there is NVDI4.11 loaded on the machine and the font is a Truetype
|Arial which surely contains the cyrillic characters.

Depending on the source of the Arial font it may not. Papyrus can
certainly read cyrillic characters if they are in the font. I have
just looked tested this. Try downloading Arial or Times New Roman
from:

microsoft.com/typography/fontpack/default.htm

These come as pc executable files (*.exe) and have to be run on a pc
to unpack them. Then copy the appropriate files (roman, italic etc)
to your NVDI font directory on the Atari and reboot (or re-install).

I use NVDI once in a while myself, but not often. I do own a printer, but
it hasn't been connected to any computer for half a dozen years or so, and
I don't think I've ever printed anything using the VDI.

>> Yeah, I need the vector fonts for word processing and web browsing,

There was a ShareWare (IIRC) vector font GDOS released some time ago.
The version I tried was rather buggy and had low quality fonts, but it
did work together with fVDI.

>> and obviously need the printer drivers too.
>>
>> Hmmm....
>>
>> Wouldn't it be nice if fVDI could develop to be a font engine too?

I do plan to support vector fonts (using FreeType), but I don't know
when I'll get around to it. It is reasonably likely that I'll write some
kind of program to convert vector fonts to bitmapped ones within the not
too distant future, though.

>> And to be able to use NVDI printer drivers.

Using NVDI printer drivers isn't a terribly useful idea, since that would
require you to own NVDI, anyway, so you could simply use that in the
first place.

As I have said before, I have _no_ plans to write any kind of printer
drivers for fVDI. For such to appear, someone else would have to do the
work (I did send the fVDI sources to someone who was interested in writing
a PostScript device driver, but nothing ever came of that (this was two
years ago or so)). I don't think it would be very difficult, but I haven't
really looked into it.

A middle road between writing a full printer driver for fVDI and using
NVDI might be to write a generic fVDI VDI device driver. With that I
mean an fVDI device driver that uses an underlying VDI for the actual
output, just as NVDI does when running on top of fVDI. That way it would
be possible to use printer drivers from one of the ancient GDOSes

together with fVDI's support for Bezier curves/areas, for example (and in
the future, its vector fonts).
If something like this was written, you could have fVDI using NVDI as a
background VDI, using fVDI as a background VDI, using NVDI... ;-)

> Why not using Speedo GDOS then?

Well, that costs money too, if not as much as NVDI.

Then again, MacOS is really unrelated to any other OS. I often encounter
problems when running Macs, but then my mother, who certainly isn't computer-
literate, has been using Macs for ten years without much trouble. After using
another system, you grow accustomed to the way it works and expect other OSes
to behave similarly. Often, other OSes do that, but not the Mac.

GEM may be limited, but at least it attempts to introduce some standard
features which one may realistically expect, whereas X is mostly a suite for
drawing windows and buttons across a network.
As for high performance implementations, do you think X is better suited for
that?

>>>Funny, but last time I checked, GEM did not network.

The problem is that we end up with something like MS-DOS or the 8-bitters.
There is a new GUI for every new program.

>>>> >> Linux?
>>
>>>rather, why not?
>>>it is widely supported, it is multi-platform, free and is opensource. What
>>>other OS can fit that?
>>
>>Why would any other OS care to fit that?

>I guess the OS wouldn't care (;-), but its users should.

All right, multiplatform can be nice, I suppose. OTOH, the "real world" is rather monoplatform as it is, and Linux isn't really multiplatform either. You can run the core OS on a lot of obscure computers, but you get none of the support mentioned above, since "Linux" is just an abbreviation of Linux/i386. Open source, who cares? Could lead to OS fragmentation, licence issues in every nook and cranny, and frankly, I'm not all that impressed with the open-source OSes. Perhaps if they'd do something else than yet another UNIX. Or yet another clone of "ls".
Of course there are good open-source projects, but the high-profile ones with thousands involved give off an unwieldy, rigid impression.
The filesystem I run right now is open-source, but it is developed by a rather small group of individuals, so it's easily coordinated. I think that it's when hundreds or thousands get involved that the project might lose its focus or guidance. There are too many agendas involved, whereas commercial OSes reflect the will of only a few individuals.
Being free releases you from accountability. You can't look a gift horse in the mouth, you can't make demands. You can't expect people to work for free only to satisfy your demands. The customer is king in the commercial market, whereas the developer is god in the open-source arena.

>I doubt you disagree that support is good.

Support is good. I suppose. I've never had support on most of my software. OTOH, support and open-source rarely go hand-in-hand. Where is the free telephone support when you download NetBSD?

>How likely is it that you'll be running TOS or Amiga OS natively on
>whatever your main computer is ten years from now? How about Linux?
>Would you rather pay for an OS or have it for free?

I really like anything which is free. Cheap is also good.
OTOH, if the free alternative isn't as good as the commercial ones, there are many cases in which free isn't enough.
As for what I'll be running ten years from now, I wouldn't know. I have no plans whatsoever to switch OSes in the near future. There really is no other OS which I fancy working with. Be looks interesting, but switching from Amiga to Be is quite pointless, you still end up in the same situation.

>In what way do you think open source is bad? Surely it must be better if
>the users can fix problems when they are discovered rather than having to
>wait for a corporation to decide to do a new release (which you might well
>have to pay for), for example?

Most users can't, and don't want to hack their OS. Besides, if you just make the OS properly modular, that can be done in most cases without access to the source. For example, new versions of AmigaOS have got a function for programs to hook into in order to make clean patches to the OS.
There are of course benefits to be gained from open source, but not exclusively, and most people just don't care.

>>Besides, you definition of "wide support" is rather odd. Would you call Be
>>or AmigaOS widely supported as well?

>While there is certainly more support available for the MS OSes, Linux
>probably comes in second. _Very_ far ahead of BeOS or AmigaOS, not to
>mention TOS.

What about Mac? I'd call Linux a dwarf in comparison with the Mac, support-
wise. And we have exactly one Linux shop in Stockholm. Reminds me of the
Amiga market, really.

>Just to put the record straight, I have within my reach right now machines
>that can run (as in have installed) TOS/MiNT, Win98, Win2000, Linux, BeOS,
>Solaris, MacOS, AmigaOS, QDOS, EPOC and a few other minor ones, so I'm not
>terribly biased.

Same here. AmigaOS, MacOS, TOS, Windows, OS/2, NetBSD around here. Should be
more, but there are only so many computers you could cram into 17m³. =)

>TIA,

Hiya

LAPD no longer exists, I took over the main library disks in November
1998, and am still working on the software.

LAPD has been merged into and has become LaST PD. the web site

www.last-pd.co.uk

I haven't had a chance to do any work on the site since I moved last
July, so my old address and postal charge details are wrong. I've not
been well enough to work on the site yet:(

I will be updating a.s.a.p.

If you are after anything specific, let me know and I'll do my best to
track it down.

I have a mountain of well over 10,000 floppy disks here and I've only
touched the surface so far!

I also have The Atari Software eXchange, which will be having a face
lift and will be updated soon. I had a nice new site 95% finished and
then a piece of software trashed the drive, so it's back to square one:(
Now who preaches backups!!!

I agree with you in pricipal, however, one needs to look at it from a practical point of view. Whether it's good 'net etiquette or not, 95% of the people you'll meet (at least in the U.S.) don't even know that there are non-Mac/PC computers still in existence and being used, let alone on the Internet. So with that in mind, why would they even worry about making a page that works on non-Javascript/non-Flash/etc systems when every system they know about can use these things? When time is precious, why spend extra time (albeit seconds) typing something that nearly no one will ever see? So from that point of view, we as the "oddballs" on the 'net *have to* catch up with the 95% of the world using Macs and PC's or else eventually find ourselves unable to do *anything* with the internet. We have to stop complaining about it and just do it, accepting the inevitable fact that we're severely in the minority here. Someone has to give in and aggressively tackle the job of either updating an existing browser, porting a browser from another platform, or starting from scratch. It can be done, but it'll take a huge effort. As technology advances and new Internet goodies are thrown into pages and e-mail, we will get further and further behind unless we as a community accept things as they are and push for better software and hardware, either freeware, shareware, commercial, or DIY.

I have a big box of stuff from my storage which includes the ST520 with a 1 meg upgrade and 2 floppy discs and the 1224 colored monitor and a lot of software. This stuff all worked when it was last played with some years ago. but I have lost one of the cables that goes from the computer to the monitor, so I can't even test it. But I know the monitor works.

Anyway I was going to put this on Ebay but I'm sick of the way Ebay is treating it's customers. It's complete BS if you ask me so ..... Other than do that I will sell everything to the best offer I get on here.

I know I have a bunch of games like wishbringer, the degus art program, I word processor program, games like sundog etc...and a lot of books with it.

PLEASE take this off my hands I'm cleaning out my storage and everything must go. I'm asking a price of $10.00 for everything plus the shipping unless someone makes a better offer.

I will not except offers after JUNE the 8th that next Friday.

Email me at mike at bigtexas.com if your interested. The monitor alone is worth

Hi Michael,

> - It gives me an alternative to Magic's stupidly short ACC list. Why
>they only put 6 slots (a la old GEM style) is beyond me. I've been told it's
>for compatibility and that Magic has no need for so many accessories, but
>that's gotta be total BS.
You can load as many ACC's in MagiC you like, providing you have enough
memory left ofcourse. You can even load an ACC twice or more times if you
would like so. Just click on a ACC and it will be lounched, you do not need
to rename it as PRG or APP either.
When you don't need the ACC running anymore, throw it out using a taskbar or
MagiC's build in menu pressing ESC-CTRL-ALT to save precious memory.

> - The ability to just drop a program or alias into the folder and it's
>instantly available, without having to run setup programs or quit and
>restart the menu.
Deskdrop can do this, freeware written by Sven Kopacz , but MagiC only I'm
afraid. It's part of the Jinnee package and located in the Extra folder. If
you don't have it, I'll mail it over....

PS: have you managed to fix the problems with the CDRW 6416 ?

Cheers from Belgium
Dennis

Hi Derryck,

>My sig offers a link to DDP's translation service and accompanies every
>message that I write in the Atari newsgroups. It does not mean that my
>messages reflect the views of that group or of the CCC, whose pages are at
>the same URL.
One would think this is obvious, but unfortunately it isn't. So for people out there that have a brain that doesn't function the way it should... Since all it takes to remove the signature from the postings, is a simple mouseclick, from now on I'll remove the sig from postings which aren't ment to be informative and avoid all confusion with DDP or/and CCC. Peter and Derryck being both members of the CCC is purely coincidental and isn't relevant either, DDP stands for translating programs and docs, nothing more and nothing less.

For the record, neither Derryck or Peter are consulted before I post here, *ALL* views expressed in my postings are exclusively my own, on occasions when we do have contact prior to posting, it's *always* about translations or stuff that DDP is working on.

As for CCC, it should be obvious that living in Belgium I have no contacts with the club at all. Which doesn't mean that I don't sympathise with what they stand for. Anyone involved in actively promoting & supporting Atari in

a positive manner has my support. If I would live near Cheshunt then without

any doubt I would be a member or at least support the club.

Anyone questioning DDP's involvement or dedication to the Atari community please feel free to ask or comment...

Cheers from Belgium
Dennis

FamilyNet Newsgate

The Atari ST as a platform has been cute, and I've tinkered with it since 1998. Had the internet working on it, newsgroups, Spectre, and 800XLDJ.

Fun computer, but honestly, as various applications stop working along the way without any thing new being added or modified, I find the Atari ST/TT platform to be at the point of tedium. When the internet connection stopped working, I resolved to let other machines handle internet browsing. I figured the computer would do well to be the virtual drives for my Atari 800, and maybe do a little Macintosh emulation on the ST. And every so often a bit of desktop publishing.

However, 800XLDJ stopped working... DRVIN works, or maybe it doesn't.... or maybe if you look at it wrong....

ARRRGGGG!!!! Enough of this thrown together platform. I could keep it around for the Spectre emulation (since I am a big fan of Dave Small's work) but again, let's get real here... a Macintosh Plus can do the work of a ST with Spectre, plus more games.

Anyway, if in the US, I have a 1040STE for sale. If in you are in Dallas or care to pay for shipping, I have a SLM 604 printer as well. If interested, drop me a letter and we'll work something out.

My hat's off to all that keep this going. If I had been an ST user in the past decade I would probably feel more at home on the ST now. However, like in the case of the Portfolio, I tasted the Newton first, and was hooked. In this case, I tasted the Macintosh first, and well.. still got that Apple aftertaste.

There are some areas that Atari simply rocks... and you'll see me on my first love... the Atari 400/800... the Jaguar, and the Lynx. Glad I could at least try out and experience the Atari ST/TT platform for a time. If it were not for the ST, and the work published for "Atari Computing" (a simply AWESOME magazine!!!) I probably wouldn't have been around as much as I have. But thanks to the ST, I regained a interest in one of my first hobbies.

Many thanks to all of you!

I guess you are right. But I just can't understand how anybody believes that this project will ever fly. How can they think they will sell more machines than Milan I were sold? And the Milan I *is/was* available and not just a project on paper and is cheaper. Lyndon's question was absolutely justified: They did say that the machine would be available in April 2001. What do they have presented since then? Nothing. Only announcements even though they said they wouldn't announce something that was not available. We have June now.

Even if the hardware became available some day, it would be a machine without software. For example, where are the drivers or browsers and other state-of-the-art applications coming from? Today users (also those that have accepted the shortcomings of Atari clones) simply do want to browse. They do want to use Java. But given the fact that software development for the Atari has almost come to a standstill, why should somebody seriously pay so much money for an Atari clone, when he can get a much faster PC for less? And this PC would even be faster with MagiCPC than the clone.

And now please don't tell me that missing software will simply be written by somebody. There are hardly any developers left anyway and writing, for example, new browsers, porting existing browsers or porting Java is such a huge effort and is so extremely time-consuming that you cannot seriously expect this to happen. If it was an option this would have already happened because Java and browsers to port have already been available for several years.

So what I basically want to say: Be realistic and expect nothing. This way you cannot be disappointed.

Well i know, im not fighting against wind mills :) But basic problem remains.. Nw stuff which is used, requirefast machines, not because it is hard, but because it is badly programed, u need p2 or 3 just to be at decent speed with things 8bit machines did.. I think jonk mentioned porting Netscape or other things.. Impossible, the code is so huge abd unoptimized that woud be slow on 060 machines as well. Did u notice that every new browser or word became slower on basic tasks too, not just offer new, advanced ones? CAB on other hand aint slow, works decent for me, has nice interface, nice modules, just lack of features (like css, etc..) i agree. Or if u checked Wensuite, its VERY fast, but not reliable.. All that proves that we have the power, but all has be done from scratch, or port with a lot of optimizing, so all that make it hard.. and browsers are BIG projects today.. Im definately going for Xgem altough im aware ethernet is needed for it

Ah, dynamical only? That may be the problem. Yes i have static IP. But did u consider getting cheap linux box (486 is perfect) for server and IP masquarading machine (i atm use TT for that)? U got PC to do all dull and hard work, its cheaper as VME Ethernet card (well neary ;), and u can do all u want with Ataris, code or crash etc... It aint bad idea.. I had get myself 486 board etc, but then got Riebl, so PC is still unassembled :)))

U think we are in minority? Hm im not so sure (as internet is concerned)
i know a lot of ppl using unix terminals etc, some on job and so on, i
think that number ain't so small.. I mean minority for sure, but i think
a lot more ppl as just Atari ppl are involved in same problem. And what
really make me angry, take a big number of Atari pages, done by "die hard
Atari fans", etc... Not viewable on Ataris at all! That IS a problem with
ppl, not the machines or software...

And its just an attitude.. why we, and amiga ppl and unix ppl can use
RTF for example as we all use GIF etc, while MAC/PC ppl use .DOC while
they have 1 zillion formats to chose when save?

Im not complaining at all. I have luck that i dont "like" WWW too much,
im still oldfashioned, rely on ftp/irc/mail mostly, even on proper letters
or good old phone call :) Nothing can beat a bit of personal touch ;))

Same Board as from Atari. Smal modifications on audio subsystem
and they remove on scsi port internal termination to fit an internal
scsi drive. DOITF030 contains any modification.

They originally bought a stock of Atari motherboards, as well as the production plans, so they could make more of the same later on. The only creative thing they ever did was to make a solution for using an internal SCSI in the LE-machines - and the table-top MKX (which should have been rack-mounted to suit musicians better...). They simply removed the SCSI-terminators that are placed inside the SCSI-connector and placed a cable for an internal 2.5" SCSI there instead.
Some people have misinterpreted this, so I want to point out that the IDE-port is available in ALL Falcons, regardless if they're from Atari or C-lab. In an LE-machine, the internal SCSI-disk uses the physical place where an internal IDE normally is located, so you may have trouble fitting one more disk there, but it's still possible electically...
The modifications to the audio system were actually made also on the last machines that Atari themselves delivered, so there was nothing new from C-lab. Those modifications are also printed in the users manual for Cubase Audio for Falcon, since Atari and Steinberg (I believe SoundPool also were involved) made those mods and explained them for all subsidiaries and service partners around the world shortly after all musicians were annoyed by the bass-boost and lack of line levels in and out...

I'm using some ancient GDOS fonts for this, it's way faster than vector
fonts under NVDI but not quite as flexible. I prefer speed and simplicity
though.

> and obviously need the printer drivers too.

Then you obviously need NVDI or SpeedoGDOS.

>drivers" instead of current ones, blacked out icon's. What's next?

Except that you've got the wrong end of the stick. I was reporting my
experience with Titan, which was entirely positive. Just to even up the
balance 'twixt dealer and customer you see.

>All i asked was "So if it's so perfect why have you posted as below? "
>
>Quite a reasonable question i think. You probably disagree but i don't care.

Neither do I TBH, it's up to you if you've got it wrong. I'm not going to
lose any sleep over it either.

>> How long have you been reading/contributing to/supporting this newsgroup?
>Reading? Many years. Contributing not long. But once stirred by your cronies
>who knows?

I don't have cronies, I have friends.

The Cheshunt Computer Club doesn't have an opinion about this situation
AFAIK. How do I know? Because it isn't a subject of conversation at meetings,
and the public mailing list isn't exactly buzzing on the subject either.

Steve doesn't like Barrie's constant advertising in the base, when a simple
email reply to the enquirer would be more suitable. Steve also happens to be
a member of the CCC, that's all.

>It dosen't matter how much you protest, the fact's remain that your two
>small
>groups contain the only people who have been abusive to Barrie in csast.

Reread my email. Coincidence only.

>All i was asking was it your groups opinion or yours? Once again quite
>reasonable.

See above. But I'll repeat: neither the CCC, DDP or myself have an opinion on
the subject.

>I will answer for my postings and views here and not behind closed doors as
>you would wish. Don't post to my email address again unless you want some
>back. Lets have a public / open discussion.

Fine by me. I've made my/CCC/DDP's position quite clear three times now, so I see no need to repeat it any more.

>|Arial which surely contains the cyrillic characters.
>
>Depending on the source of the Arial font it may not.

This one does. On a PC the document was displayed using exactly this font
file, and on the Atari, the required unicode cyrillic characters appear in
the correct places in the "character set" table and can be "typed" by clicking
on the character required (btw. how are they brought forth to the kayboard
keys).

>Papyrus can
>certainly read cyrillic characters if they are in the font. I have
>just looked tested this.

Yes it can- but! It can read unicodes (for example cyrillic "ABC")
from a .RTF file if they are encoded like:

... \ansicpg1251 ... \'c0 \'c1 \'c2 ...

i.e. mapped into 8-bit space but apparently not if they are encoded like

... \u1040 \u1041 \u1042 ...

which my document contains. The problem is why the doc-convertor module
(converting .DOC to .RTF) of Papyrus creates a .RTF file with sequences
like \u1040 \u1041 ... which Papyrus does not interprete (for me, at least).
What is wrong?

It is most unfortunate that maybe some personal issues are not resolved.
I have dealt with Fredi on several occations, his English is the worst
I've ever seen for someone trying to sell something globally. I manage
though and he has always delivered promptly. Perhaps not at the price I'd
rather pay, I won't pretend the items he sells is cheap.

My only real gripe is with the rage pro. Had I known the drivers where
so bad I would of went to Ebay for a Mach64 right off the get go.
Outside of that I have to say Fredi has delivered a machine where
others have failed, even if one does not agree with his ways or his
prices. ;-)

> than the clone.

More good points. I have my reasons for sinking alot of money in a clone
and it's ultimately and end users personal wishes that decide the out
come. I almost got a mac, I understand your logic very well. I was
very confused for sometime which route to take. Very!

> And now please don't tell me that missing software will simply be

> have already happened because Java and browsers to port have already
> been available for several years.

I won't make any excuses for the lack of software, I know how bad it is.
I have been sinking money in this platform since 1986 or so. I am not
convinced xtos will appear, however seeing how Fredi has delivered clones
in that past I cannot rule it out so quickly. At the same time I don't
constantly sitting around waiting or hitting that web page for details.
However, I don't think constant negative comments help matters either.

> So what I basically want to say: Be realistic and expect nothing. This
> way you cannot be disappointed.

I expect nothing, hense why I bought the Hades, no point in waiting.
If it appears fine, if it don't fine. Why comment if it amounts to
nothing then? If Fredi runs himself into the ground trying to develop
it that is his problem... just let it runs it's course silently. ;-)

Nothing specific. I'm the maintainer of the Ultimate TOS Software Index
(aka UTSI). The meaning of the UTSI is to offer people links where they
can download stuff. In the game section for instance I found links
whichs points toward LAPD (Body Shop, Clod hopper, etc..)

Ditto, hence why my spare TT is for sale.

For me, the math is simple: most recent GEM apps really require MagiC and fail on MiNT/N.AES, UNIX tools run better and faster on my slow Linux box than on MiNT, the Riebl drivers and sockets constantly crash when transfering files within my LAN if the next machine is less than 15ms away from the TT.

Honnestly, while amazing work has been done on the MiNT kernel (despite my heavy criticism of some decisions made by Frank and Guido, I nonetheless admire the efforts they have put in), the Reibl drivers are less than sturdy than they should be, which prevents me from using network daemons to serve my LAN.

As for all recently ported UNIX goodies, nice, but no cigar: the same packages compile twice as fast on my 25MHz 486 Linux box as they do on the TT and they also run smoother and faster there.

I won't make the same mistake as other people and sell my last Atari, though. The first TT still remains attached to my LAN and the Stacy in storage for MIDI purposes.

> order.

Two autofolder programs, Xboot and Diab630. My SLM is from Pre-extensible control panel days, so I do not have a Diablo CPX. I'm guessing that may have been part of the SLM605 (?) laser package, which was the Epson Action laser. I'm guessing now that I also have the older buggier versions. It's entirely possible that I never had the SLM attached to the TT, but I know I had it attached to my Mega 4. If I remember correctly, I have the latest version of the Setup630 acc on an old Supra 10 meg floppy somewhere, but I'm not sure where that floppy is at the moment. I'm sure I don't have any newer version of the emulator program itself, DIAB630.

> Hopefully you have the 630 autofolder prg on;-).

If you mean DIAB630, you bet. <G> It installs, loads the fonts, the spits out that the SLM804 is not detected.

> Also do you need edith?

Not Edith exactly, but I do need a text editor accessory. When I'm using DynaCADD, I need a text editor acc to keep my materials list on. Any basic editor would work, but I like edith. My next favorite is STeno, but I've not tried any of the new editors out there, like Everest or QED.

> Get the diablo working then add the other programs.

As noted above, it runs. It's always possible that the file is slightly munged on the original floppy after all these years.

> Do your 630 fonts load? Does your 630acc work? Will it test print?

Now this is interesting here. Even tho' the screen shows the emulator installing, the 630 acc says no driver is installed. Speculation: the driver is dumped from memory when it can't find the SLM804. And no test printing either, TEST.PRG reports no SLM detected.

I wonder if the later versions of the software are anywhere to be found these days.

I hate to have to dig out my Mega 4 and try this. But that may become a last resort. <G>

190. Family Tree goes multimedia

Newsgroup: comp.sys.atari.st
Date: 2001-06-03 15:35:57 UTC
From: d.briel@free.fr
Message-ID: <xPsS6.1258$Cn4.2582603@nnrp3.proxad.net>
Source record: 45257

Dear all,

After a long silence, Family Tree has finally been updated.

Family Tree is a a genealogical database by Ian Baker.

The new version 3 allows to link any document (Word processing, images,
sound, etc.) to persons, using hyperlinks to call associated programs.
Though this works best under a multitasking OS, it works also under single
TOS, using VA_START compatible accessories (e.g., 1ST Guide).

Apart from the new multimedia feature, Family Tree still has the same
main features:
- compatible with ST, STE, TT, Falcon, MultiTos, MiNT, MagiC, every
resolutions >= 640*200,
- all dialogs are in non modal windows,
- ST-Guide contextual on line help,
- Full ST-Guide user guide,
- compatible with GDOS, SpeedoGDOS and NVDI,
- system clipboard management,
- import and export in GEDCOM and CSV format,
- comprehensive data handling (e.g., 40 children per mariage, unlimited
number of mariages, handling 'circa' dates, etc.)

Family Tree 3 is available at:

likewise . I actually sold my Falcon to one of my friends at a TAF
Flea market, only to use part of the profits to buy a TT that MGI was
selling off. Turns out it was an original deveoper's machine, with
German TOS. It's sitting in my apartment on a shelf in my computer desk
system, and it's being used mostly as a backup system for all my synths
and my GP-8. But I might also set it up as a backup Internet machine now
that I have an external modem again :)

These days my main new project is a UMAX J700 I'm slowly modifying
into a powerhouse to eventually run OS-X on (and yes, it HAS been done,
according to some pleasantly surprised J700 and S900 owners).

192. Best price on SCSI adapters

I made the mistake of purchasing an IBM HD. It doesn't seem to be very compatible with either the onboard scsi interface of my TT (of course that has problems of its own) or the Link 2 interface i've already got hanging off my STe.

So, with that in mind. What would be a good scsi drive choice these days for an atari? Any brands safe? Should any brands be avoided?

I am putting a list togther slowly (exams take priority) but check out
http://www.lyndonamsdon.co.uk then go to devices and select the SCSI
drives section. Should be there, I think IDE HDs aren't there but you
want SCSI. I will need to add comments like if the drive is from the same
family. eg seagate barracuda then all barracudas should work, as the
firmaware is the same throughout the family.

Also, don't get differnetial SCSI, wide or ultra is fine as long as you
have appropriate adaptor. And SCA is just 80pin AFAIK and again should
work with appropriate adaptor.

What model and size is your IBM and what is the problem?

The TT interface is a standard interface that is known to work
flawlessly. It's more likely that there is something wrong with the
termination or cables. Without more details this is hard to tell. I have
never heard of IBM hard disk drives not working with the TT or Falcon.
IBM drives are quite often used for the Atari.

> So, with that in mind. What would be a good scsi drive choice these days

Honestly, I recommend IBM drives.

No, this doesn't work. It's just the main page that gives
problems. When, in (text mode only) I load the "Operating
System Results", "must have features" and then activate
"show pictures" again, then the pictures of the operating
systems, must have features etc... show up normally.

Cheers

I have a very different story to tell. The cartridge port/pocket Ethernet adapter I use simply works perfect. It's been turned on 24 hours/day now for 5 months and everything is very reliable. I run it with STinG under Geneva and lately Magic and sofar the TT has crasched two times. This happened because I run Popwatch checking for new mail at 10 minutes intervals.

Popwatch causes a memory leak and framgentation within STinG memory. After a few days the biggest STinG memory block is reduced by 50 %. I also run this TT as a router to my second TT through Modem 2. The fragmentation seems to burden down the STinG kernel and TT No 1 starts to drop packets on Modem 2. I have yet not had a single dropped packet on the Ethernet port, though.

Both the TT No 1 crasches occured when under load from TT No 2 and with severe STinG memory fragmentation. TT No 1 runs the Weblight web server and there are quite a few visits a day (around 20). So, when running alone without routing to TT No 2 it is 100% reliable. I have now set Popwatch to only check for mail every 20 min and memory fragmentation now also is halved. I now have to reset TT No 1 appr. once every 5 days.

I am also ftp-ing a lot with servers on both TT's and a client on my Windows computer and it simply works perfect.

>As for all recently ported UNIX goodies, nice, but no cigar: the
>same packages compile twice as fast on my 25MHz 486 Linux box as
>they do on the TT and they also run smoother and faster there.

For my uses the TT almost matches my P-133 pc. I use the pc mostly for surfing the web where it outperfomes any Atari. Outlook Express on the other hand is simply a joke both speedwise and in functionality compared to Okami on the TT.

I have had some hardware problems with TT No 2, Calamus and Cubase refused to run, two bombs in TOS desktop when cache turned off etc. Two weeks ago I tried to install Magic. It did run for a few minutes when the computer was compleatly cold. After that no luck at all. My Geneva/Neodesk setup however worked perfectly. Strange.

I took it apart and removed the TT RAM (old 4MB SIPPS) and now it runs perfectly with Magic. Actually I have set it up to run the web server so it's been running for two weeks now.

I then put the TT RAM card inside the other TT. Both are of the older type with similar serial numbers. This TT works perfectly with the same RAM card and Magic. Before the switch I off course reseated all chips etc.

Obviously something is wrong with one of my TT's as the RAM card only works in one of them. But for now I will keep this setup as I only have one TT RAM card.

With Magic on both TT's I can now use Modem 2 at 153600 bps with around 14500 Bytes/sec in CAB on TT No 2.

Hmm. It was an IBM Orion DORS 31080S. I tried using it with the term resistor jumper on and off.

Couldn't get it to work But I'm pretty clueless when it comes to SCSI.

I've used IBM & Seagate with no problems at all.

Make sure the drive is SCSI-1/2 and not ultra wide etc...

Some adapters also don't like parity set!!!

Yep, I've consider that but I've finaly bought me a second hand Mac (my
brother have one, do you get the picture?) which I regret more of the
less now. I really don't get used to that machine. Maybe MacOX will
suites me better but I'll wait to update the OS as it seems MacOS X is
rather buggy for the moment.

I do all the work on the Hades. The Mac is only used as gateway. I use
the mac only to visite pages which are unreachable with Cab.

This seems very odd to me, I've got a TT with Cattamaran and 3 486's running linux (1 at 25mhz and 2 at 66). The TT outruns any of them without breaking a sweat. I do use (and really like) linux but with versions 7+ of Redhat bloating up to 2 CD's my trusty 486 machines are having a hard time keeping up.

I had a similar IBM 1Gig drive on my STe (I use adscsi+). I formatted it into 4 equal partitions. My only problem was I forgot that the dealer I bought my original HD setup from had configured the ICD drivers not to recognize drives beyone I: once that was fixed I've had smooth sailing. Of course this hasn't made me immune to problems with other IBM hardware but thats another story.

Maybe one of the last... at least one of the longest running Atari BBSs in existence is PayBax BBS in Wilmington Delaware, now in its 14th year. Give it a call to continue its prescence!

302-454-7797

Running on FoReM, it is not Y2K compliant so the year is 1986 or something like that...

Are there any others??

The Grove Online has re-opened its doors after a good 7 year or
so absence. Its the only online Atari ST BBS. Just telnet to
"shadow.skeleton.org", and login as "bbs" to use it. The website is at
"http://www.skeleton.org/bbsindex.html"

Here is how to simply things a little.

TT RAM chips must be 30 pin 1Mb or 4Mb x 8 non-parity nybble mode SIMMs.
^^^^^^^^^^^^^^^^^^^

The 8 means 8 chips on each memory card, NOT 9 or 3, they will not work.
I purchased my chips through Memory Supersource 1-800-457-6837.
Item # WM4000870S 4MX8 70NS SIMMS

The newer TT RAM boards it will have 6 jumpers labeled w101 to w106.
The jumpers settings are as follows:

w101 w102 w106
1M x 8 SIMMs (4MB) 2-3 2-3 2-3
4M x 8 SIMMs (16MB) 1-2 1-2 1-2

jumpers w103 & w104 are for the start address remain the same 2-3
jumper w105 is for burst mode ON 2-3 OFF 1-2

The drive may also be SCSI-3. As far as drives with a 16 bit bus
interface are concerned (it's already quite hard to purchase drives that
still have an 8 bit interface) adapters are available. These adapters
are nothing Atari-specific but standard computer equipment.

> jumper on and off.

At least one of these settings has definitely been wrong because you
have to terminate according to the SCSI standard. The devices at the end
of the SCSI chain *must* be terminated, the other devices *must not* be
terminated.
A minority of SCSI drives requires the computer to have a SCSI ID of
it's own (initiator identification). This can be solved by software for
the TT and Falcon. But as far as the ST/STE is concerned the only host
adapters that work with such a drive are the LINK96 and LINK97.
In the case of your drive I know that a lot of users (not only Atari but
also Mac users, even experienced ones) had problems with it. Not because
something is wrong with the drive but simply because this drive is
very sensitive with respect to wrong termination.

This is good to know! Although I still would prefer them all to be in the
drop-down menu (yes, I know Taskbar can do this, I just like things certain
ways. I'm weird that way :)).

>> - The ability to just drop a program or alias into the folder and it's

This sounds interesting! No I don't have Jinnee (except for the demo), so if
the demo doesn't include this, it might be good if you could e-mail it to
me! Thanks!

> PS: have you managed to fix the problems with the CDRW 6416 ?

Nope. Not yet. Haven't been able to update my drivers. I've played with SCSI
I.D. and termination, as I got the drive from someone else and tried
integrating it into my system without changing much on it (as I didn't know
much about SCSI until recently). It's kind of a strange DIY-type cable
connecting an internal drive to the external drive chain. My next step is
double-checking the condition of the cable itself. I still can't get any
driver but ExtenDOS to even acknowledge the drive exists.

From what I could tell, C-Lab bought the remaining Falcon motherboards from the Atari wearhouses when Atari was winding down. So they should be pretty new boards. On the motherboard's front right corner, there is a revision letter. This will tell you which board you have.

I agree. The guys who are developing the Pegasus TOS clone have also made other TOS clones such as the Hades060 so they do have a track record and I think they deserve some support for developing a newer more up to date machine like the Pegasus.

> think that number ain't so small.. I mean minority for sure, but i think
> a lot more ppl as just Atari ppl are involved in same problem.

From my experience, Unix terminals for Internet access is becoming very rare. Most universities offer free Unix shell accounts, but more and more students have either free or inexpensive Internet accounts of their own. And every job that I've ever been to has graphical 'net access if they do offer it. I personally know very few people who actually browse using Lynx.

> And what
> really make me angry, take a big number of Atari pages, done by "die hard
> Atari fans", etc... Not viewable on Ataris at all! That IS a problem with

This is true. I completely agree here.

> And its just an attitude.. why we, and amiga ppl and unix ppl can use
> RTF for example as we all use GIF etc, while MAC/PC ppl use .DOC while
> they have 1 zillion formats to chose when save?

Because it's a standard. One can use any format they wish, but to be truely effective, it's best to use what most people use and are familiar with if you want it to be seen by others. Most people in the non-Atari/Amiga/Unix world use MS Word, and since *.DOC can save more detailed info than RTF, and is more commonly accessible than other formats, that's what's best to use. That's why Papyrus' *.DOC support is such a selling point. It's an issue of practicality, not a "conspiracy against smaller platforms" or "blind leading the blind" sheep mentality.

> Im not complaining at all. I have luck that i dont "like" WWW too much,
> im still oldfashioned, rely on ftp/irc/mail mostly, even on proper letters
> or good old phone call :) Nothing can beat a bit of personal touch ;))

Of course, for interpersonal communication, phone calls, letters, and visits are the best. But for research, spreading information that anyone can see and use at any time, and fun (most important), the WWW is very practical.

Hi Ken,

>I wonder if the later versions of the software are anywhere to be found these
>days.

I'm 99% certain that there's a latish version of the Diablo stuff on a web
site, not that I know the URL of course :-(

I came across it by accident, but it's likely to be on one of the major German
author's web sites. A judicious search on Google might well turn it up.

Are you absolutely sure that the problem is due to the software? Can you print
to it from other software via GDOS?

227. Ultimate Virus Killer 2000 (Atari ST/TT/Falcon virus killer)

Newsgroup: comp.sys.atari.st
Date: 2001-06-04 10:19:24 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <0nnmhtkg937vb1rle61g1epqkss19qavvq@4ax.com>
Source record: 45196
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

Nice to hear.

> Popwatch causes a memory leak and framgentation within STinG memory.

Same problem with MiNT, overall. No memory cleanup in the kernel
and, worse, 1.16 kernels use 8k memory pages, which eats up ram
faster than a bunch of kids left loose in a candy store.

> Both the TT No 1 crasches occured when under load from TT No
> 2 and with severe STinG memory fragmentation.

Only the Riebl drivers crash. I can still run those damons to
loopback or over a PPP link, although PPP is both slow and buggy,
which using Frank's XDD drivers only makes worse, amazingly.

> TT No 1 runs the Weblight web server and there are quite a
> few visits a day (around 20).

Wow! Now, _that_ is a lot of visitors... for a web site in 1994.

> Obviously something is wrong with one of my TT's as the RAM card only

Same here. Hardware swaping solved all mysterious crashes.

> With Magic on both TT's I can now use Modem 2 at 153600 bps
> with around 14500 Bytes/sec in CAB on TT No 2.

Which was exactly my point above. With Magic, not MiNT. Moot.

LOL, and that's coming from someone who's running a 1040STE.

A word of advice to the people who are fed up with their Ataris:
Send your old machines to me, then buy yourselves a Milan or a Hades. You seem to be expecting very much of 68000 or at best 68030 machines when there are faster, better machines available.

Hi Jo Even,

>Jinnee does a lot of weird stuff to achieve the transparent effect, and
>not all VDIs support it fully.
The so called "special transparant" mode can be switched off in Jinnee in
case of difficulties with the installed VDI. If that is enough to make it
behave correctly remains to be seen ofcourse :-/

There's also an option in Jinnee which allows icons to be viewed correctly
when running in 16 or 24 bit resolution. I suppose that this option wasn't
selected, hence the black icons...

Cheers from Belgium

Hi Michael,

>we as the "oddballs" on the 'net *have to* catch up with the 95% of the
>world using Macs and PC's or else eventually find ourselves unable to do
>*anything* with the internet. We have to stop complaining about it and
>just do it, accepting the inevitable fact that we're severely in the
>minority here.
Not necessarily so, sometimes a minority can make a difference, but that minority should make it self heard, a silent minority serves no purpose.
Reflect on this: about a year ago I received a letter from a Belgian mailorder company from which I bought a lot of stuff over the years informing me that they were very pride to announce their online shop... yep, you guessed, CAB couldn't make head or tales from it. So I wrote them a nice letter telling them that because of using silly "flashy" gimmicks I couldn't access their site and although regretting it very much I would in future buy online from the competition which has a website my browser can access.
A couple of months ago they sent me a leaflet announcing their updated website, guess what? CAB can access it :-)
I'm not saying they went through the trouble of redesigning their website just because of me, but merely informing them that not everyone out there uses IE or Netscape.... If there's one thing an online shop doesn't like, it's *possible* sales falling through ....

>As technology advances and new Internet goodies are thrown into pages and
>email, we will get further and further behind
I'm not so sure... new technology involves projects like the www on a cell phone, www on TV settop boxes etc. I really can't see a cellular phone handling things like "Flash", not to mention Javascript. Same thing for the settop boxes, these are ment for an entirely new audience that is not computer literate... we're talking of millions of new users here!!
The webdesigners will have to take this in account when designing their fancy webpages... meaning they'll have to go back to the basics, and that's exactly where we fit in, with a little luck in two years from now CAB will access everything :-)

BTW: anyone here knows if the Sega Dreamcast can handle goodies like JavaScript, Flash etc? and what about the PSX 2 which should be able to access the www soon also?

Cheers from Belgium

This is not about being superior and putting people down. Believe it or not
but I respect what you have done in the past for the Atari community. No one
is questioning this either AFAIK, I've heard and read only positive things
about TUS. You seem to think that I've got something against British Atari
dealers... really, I don't! Except for that crook from up north ofcourse :-/

>As you say the "past is history" so what crusade have YOU been on all these
>months?
Now you are implying things ...
TUS serving the Atari community is history, what is happening here isn't
history at all, let's try to sort this out once and for all. You claim to
have all the relevant postings... and even if some posts are missing, then
there's always Google.
Barrie started the abuse and slandering *towards* me, this is not about who
slandered who for the very first time, I don't care who started it and I
don't care for whatever the reason might have been either. It might have been
Steve, Barrie, Shiuming who knows...
This so called crusade is purely personal now, right from the start Barrie
managed to call me a liar, if I would call you a liar in public I suppose
you would like to know why? I've asked and got some abuse back, I've asked
again and also demanded a public apology....
Call me silly, but no one calls me a liar in public and gets away with it.
I've been called several "nice" things in different threads by different
people, but this was always in the heat of a discussion. With Barrie it's
different, there wasn't even a discussion. Coming foreward supporting Steve
was enough to revoke Barrie... take a good look at the posting, and then
honestly tell me if the support for Steve in *that* thread on *that* topic
was misplaced...

>How would you like someone to start attacking your character in
>public? Would you fight back or hide behind your keyboard?
I think I just answered this question :-/

>>>BTW has Lai posted recently?
>>Is your newsreader playing up again?
>Just asking him to tell the group the original story that he spread. I
>can't understand why he wont tell the group. Or is it because he dosen't

>like to admit that sometimes we get it wrong when we look at both sides of
>a story?
Dave... for god sake!!
It should be pretty clear by now that no one here has the faintest idea what
that original story is. You've been hinting at it since your first posting
in this thread. I can't find a posting to CSAST from Shiuming dishing out
some story, even on Google there's nothing.... so once again, please inform
us at least what it's about. A hint like the postings ID number is enough.

>sweet is the one with a problem. We can all tell what he implies but he is
>too spineless to go any further and be proved wrong.
That's purely your opinion ofcourse...

>Just face it Dennis, sweet has _used_ you as a mouth piece so don't
>be surprised when you get told to sod off on the grounds that
>you haven't got a clue.
This is your personal opinion once again....

We can write another hundred postings expressing our opinions, but we'll
never see eye to eye. Barrie suggested it, and I took him on... if Barrie
speeds up the procedure somewhat he'll be able to explain and proof how
innocent he is in court this fall. No doubt that the outcome of the case
will be posted here, so then it will be very clear to see who exactly has
been using who as a mouthpiece. Would you like to place a bet?

>You and your group members started all the abuse and dragged others in.
>sweet's postings implied wrong doings based upon a story spread by lai.
>Unfortunatley for sweet, lai had already retracted it in private email.
>However, sweet still used it in his postings and i simply responded only
>with the same level of abuse that you and your group had dished out.
First of all: there's no such thing as me and my group. Secondly: I have
never reacted on a story spread by Lai, proof me wrong if you like....
Thirdly: your postings were pointed towards me and not Steve, once Steve
joined "the discussion" you had a go at him. I can't find any clues of the
alleged story which you obviously feel very strong about in Steve his
postings either...
Oh... about the abusive language... have a good look at the long list of
postings from me in several of the "Barrie" threads, surely you'll notice
that I don't use abusive language that often... and when being abusive I
like to think that it's still between the margins of what is acceptable. I
don't use abusive language in real life, and see no reason to use it on
internet. Using abusive language doesn't help at all in getting ones points
across, most of the times it turns out to work counterproductive, as been
shown in this thread....

>I will gladly go back to reading the group and posting occasionally in a
>polite manner as i have over the years. Just as long as you and your
>group do the same.
I can't speak for other people, but this definitely is my last posting in
this thread... all that needed to be said is said, I have nothing more to
add. I imagine that everyone who downloads CSAST has put a filter on this
thread, I know I would have done so...

TBH I'm fed up with this thread !! this morning a very nice French program arrived here, I'm going to do what I like doing best.... translate the damn thing so that the English speaking Atari community can use it to their best advantage. How's that for making up to the group for having to download all my "useless uninformative blablabla" last month ?

Cheers from Belgium
Dennis

Hi Steve,

>Is there a way of telling the revision no. of an existing setup?.

Not really, MagiC 6.10 has had three revisons, but still carries the
6.10 tag. One can tell by the date which is shown in the Magx config
CPX, what version is running, the first version is dated 18.07.98, I'm
using MagiC 6.10 from 13.3.99 which is the second revison, I've no
idea what date revision 3 carries, but I'll be able to tell you quite
soon :-)

Cheers from Belgium
Dennis

Hi all,

I search a program, that I can copy in the Auto folder and that switch
off the NVDI driver when I installed the NOVA graphic card driver and
that switch on the NVDI driver, when the NOVA driver not installed.

I know, I have seen this program on a web page for a long time, but I
doesnï¿½t know the url of this web page or ftp server.

I once wrote such a program. It's no longer available on my web-site, but
check your mailbox, it should have arrived by now :-)

You're *extremely* lucky then. I've tried this exact same thing many times,
and the responses I got back were that my computer was out of date, and I
should update my system, etc. People like Flashiness, and whether you
believe this or not, Javascript can sometimes be useful and make a web site
easier for the computer illiterate to use. One could surmise that these
companies that use Javascript, use it for a reason, which is to make their
site more user-friendly to the average consumer (as the "average" person
owns a PC or Mac with their defacto OS's, not a little-known machine or OS).
They would never want to loose the customers they gained from their easy web
site in order to make the site harder to use again because some guy with an
Atari wanted them to. Even if we can sway the odd site or two, we'll never
as the minority be able to sway the course of the technology itself. It will
keep going, and eventually we'll be so obsolete, our systems will hardly be
usable at all on the web, or whatever comes next. That is unless we can
catch up to the present level and instead of having 20 things to catch up

to, we'll only have to catch up to new technology as it comes out.

>> As technology advances and new Internet goodies are thrown into pages and
>> email, we will get further and further behind
> I'm not so sure... new technology involves projects like the www on a cell
> phone, www on TV settop boxes etc. I really can't see a cellular phone
> handling things like "Flash", not to mention Javascript. Same thing for the
> settop boxes, these are ment for an entirely new audience that is not
> computer literate... we're talking of millions of new users here!!

I really don't see these things taking off like you suggest. I've seen these things (like Web TV and such) in stores, and people very consistently pass them up to look at computers, or briefly stop and look out of curiosity, then move on, saying they're neat, but they can do that with their computer. I personally know absolutely no one with one of these, and most people I've talked to would rather have a computer so they can do more with it than a set-top box. And who's to say that the next set-top box won't be able to do these things. I think people will be more apt to complain to the set-top box maker about lack of features than to complain to sites that they have too many features that their box can't handle.

And fewer and fewer people are computer illiterate these days. You really can't exist in this world if you can operate one. As far as cell phones and game sets offering web support, no one uses these as their main web access machine. Phones are just for when you're away and you have to look up your stock listings and such, not serious web searching and such.

> The webdesigners will have to take this in account when designing their
> fancy webpages... meaning they'll have to go back to the basics, and that's
> exactly where we fit in, with a little luck in two years from now CAB will
> access everything :-)

Back to basics = boring. At least to the minds of those creating them. Personally, having an Mac to browse with, I enjoy the added functionality and "flashiness" that Javascript adds, and Flash makes things look absolutely incredible and cool, and I do occasionally enjoy a Flash or Java online game or two, even though I'm not that into games. I (and most people you'll run into, I think) am very visually oriented and aesthetics are very important to me. Taking away something that has added something nice looking, easy to use, and helpful to web browsing would take us backwards in technology, not forward. Besides, there are sites out there that wouldn't exist if it wasn't for Flash. They're just fun sites to play on, and if they were removed because they were against web regulations for not being strictly HTML compliant, there goes an element of fun that would be removed from the web.

> BTW: anyone here knows if the Sega Dreamcast can handle goodies like
> JavaScript, Flash etc? and what about the PSX 2 which should be able to
> access the www soon also?

I'm sure they'll find a way to do it. These systems are all about flashiness. Especially since most of the people using them are kids and game

players, they'll want the online games and flashy graphics that Flash and other new web gadgets offer, otherwise, what's the use to them? Also most people who have a video game machine probably have a computer, too.

Anyway, like I said, we've got to just bear down and get a working HTML 4/CSS/Javascript/SSL browser that is usable (yes, it *can* be done!) and can use multimedia viewers like Aniplayer (like CAB does) to view embeded video and such, and eventually work on things like streaming audio/video protocols and Flash. It's a huge order, I know, but this is how far behind we've gotten because we've sat on our butts and complained about advancing technology. The moment we insist something isn't necessary (like Javascript) or that it's going out of style, simply because we as Atari users can't use it and make excuses for why others shouldn't be able to as well, that's the time this new technology finds it's niche and really takes off, leaving us in the dark ages. I've seen it happen nummerous times here, and it's probably the most frustrating part of being an Atari user.

My TT is running the JYBOLAC Stargate BBS. It is telnet only, however, and not an old BBS, but a new one.
Try telnetting to telnet://jybolac.dyndns.org:520.

Also, the BBS program itself it written in PERL and should work under MiNT, maybe with a few modifications.
If anyone is willing to try this program out under MiNT and setup their own telnet BBS, let me know. (Actually,
if you have any machine running Linux (x86, whatever), and you want to give it a try, let me know as well.)

On 3 Jun 2001 10:20:03 +, Djordje Vukovic wrote:

|>|I received a MS-Word document which contained text composed of unicode
|>|characters, mostly, (but not exclusively) corresponding to MS code-page 1251
|>|(Cyrillic). I tried to load it into Papyrus (demo) 8.23, but all characters
|>|except punctuation marks were shown as blanks. Papyrus was set in
|>|Options-compatibility to treat characters as Unicodes, but it did not help.
|>|Changing RTF-import encoding to code-page 1251 or anything else did not
|>|help either.
| . . . .
|>Depending on the source of the Arial font it may not.
|
|This one does. On a PC the document was displayed using exactly this font
|file, and on the Atari, the required unicode cyrillic characters appear in
|the correct places in the "character set" table and can be "typed" by clicking
|on the character required (btw. how are they brought forth to the kayboard
|keys).
|
|>Papyrus can
|>certainly read cyrillic characters if they are in the font. I have
|>just looked tested this.
|
|Yes it can- but! It can read unicodes (for example cyrillic "ABC")
|from a .RTF file if they are encoded like:
|
| ... \ansicpg1251 ... \'c0 \'c1 \'c2 ...
|
|i.e. mapped into 8-bit space but apparently not if they are encoded like
|
| ... \u1040 \u1041 \u1042 ...
|
|which my document contains. The problem is why the doc-convertor module
|(converting .DOC to .RTF) of Papyrus creates a .RTF file with sequences
|like \u1040 \u1041 ... which Papyrus does not interprete (for me, at least).
|What is wrong?

Well you seem to have narrowed it down to the DOC2RTF module. I
presume you have the text giving the relevant formats/platforms
supported? In my case these are:

Formats (2,6,7,97,[2000])

Platforms Windows 95 (DOC2RTFW.EXE), OS/2, (DOC2RTF.EXE)

There is also the warning: Files in MS-Word "quick-save" format are
not supported.

If you have access to a pc (as you seem to do) I presume you can
export it from Word in RTF and import into Papyrus? Alternatively,
you could download the demo of Papyrus for the pc and use that.

I made it, this is not easy and had some problems.
-First, not all 4Mb ram works(tt-ram boot test fail). I had to change
resistors RP102 and RP101 downto 22ohms. I also had to change burst
mode to standard mode because Atari use some specials kind of ram for
burst mode.
-Second, some programs bomb. Trying to copy a big file from a
partition to another bomb all times. No solution at this time.

In futur(long time :-)):
- I think to change again RP102 and RP101 for lower value.
- Try to add buffer(74HCxxx)?
- make another board with same electronic with 32 bits sim and buffer?
Very difficult because of double side and metal holes.

If you don't understand my bad english, i can write you in french :-)

>that switch on the NVDI driver, when the NOVA driver not installed.
I suppose this is a silly question... but why on earth would you want to
switch off the NVDI driver when using the NOVA?
NVDI and NOVA are made for each other, the NOVA card in general performs
better also when used with NVDI.

To answer your question: the most obvious solution seems to be using a
bootprogram like Xboot... but I suppose this is not what you've got in
mind?

Cheers from Belgium
Dennis

:) True.

> A word of advice to the people who are fed up with their Ataris:
>Send your old machines to me, then buy yourselves a Milan or a Hades. You seem
> to be expecting very much of 68000 or at best 68030 machines when there are
> faster, better machines available.
> --

(Sigh!) It's intriging. The Milan and Hades really do look quite nice,
but in the end, don't you basically get a computer that can run 25% of the ST
software (games included in that equation) and all the remaining 75% with the
blazingly fast 68060 processor allow it to crash at 20x the speed of a TT. :)

In the end, you got a nice working machine, which has some good word
processing, desk top publishing, Midi if you're lucky, some IBM emulation,
Spectre and Mac emulation seems to only have made it to the TT level, and
though you can get graphics and sound cards, (assuming you are able to locate
those holy grails on the even more fun to find Hades and Milan, which is
especially fun on this side of the pond), no matter how fast you go, CAB is
still quite limited.

So let's see, for the price well over a iMac (Speaking of the Hades and
Milan) I get a computer that can't move as fast, can't surf worth anything, can
run a quarter of it's platform's own software, and even if it could run the
whole assortment, that is about 2% as many as you can find on a PC (being
generous on that one) and about 10% of what can be found on a Mac.

Oh yes... where do I sign? :)

I'll be the first to say that I use my computer for mainly BBS'ing, E-mail,
newsgroups, and a few games. So 25% might be enough for a fairly fun computer.
But in all truth, being a Jay Miner fan, I might follow the linage of the
Atari 800... and try the Amiga for a while. (That step-child of Atari) LOL

Take care,

Doctor Clu

249. Re: Papyrus and Unicodes

Newsgroup: comp.sys.atari.st
Date: 2001-06-04 23:25:49 UTC
From: vdjole@EUnet.yu
Message-ID: <9fh5dpefe1@news.eunet.yu>
Source record: 45217

On 3 Jun 2001 13:48:28 -, Steve Sweet wrote:
>Hi Djordje
>
>>Is there a way to make Papyrus read the complete range of unicodes?
>
>This may seem a bit obvious, but are you using a font that actually has
>these characters?.

Yes! The problem is something else: as I said, doc-to-rtf module of
Papyrus produced a .rtf file which contained something like below
(all irelevant stuff deleted from rtf file):

```
{\rtf1\ansi\deflang1024{\fonttbl{\f1\fswiss Arial;}}
\f1\fs24 >\u1041 \u1048 \u1041 \u1051 \u1048 \u1032 \u1040<
}
```

This file contains seven cyrillic characters between > < characters.
Papyrus interpreted these character sa blanks. On the other side,
the same seven characters, typed in Papyrus and saved as a .rtf file
containing something like below (irrelevant stuff deleted again):

```
{\rtf1\ansi\ansicpg1251{\fonttbl{\f1\fswiss\cpg1251 Arial;}}
\f1\fs24 >\'c1\'c8\'c1\'cb\'c8\'a3\'c0<
}
```

which could be later read back in and papyrus showed cyrillic letters OK.

These two files segments can be extraacted into .rtf files and read into
Papyrus if someone is willing to check.

So why were not the \u... control sequences produced by Papyrus's own module
recognized, but same unicodes re-mapped into 8-bit space were ok.
This mapping is defined for Papyrus in its file WIN1251.MAP as below:

```
CHARSET-NAME=MS Windows Codepage 1251 (Cyrillic)
CHARSET-NAME-GERMAN=MS Windows Codeseite 1251 (Kyrillisch)
CODEPAGE-NUMBER=1251
#
# Characters 20-7F are identical to ASCII (ISO 646)
UNICODE-MAP=
# 0 1 2 3 4 5 6 7 8 9 A B C D E F
# ================================================================================
80: 402 403 201A 453 201E 2026 2020 2021 * 2030 409 2039 40A 40C 40B 40F

I am not aware of TAF biting the dust. However TAF is a Toronto organization.
The Canadian Atari User Group is a virtual users group with a Canadian Focus.
A forum where we can address Atari Issues specific to Canada.

Later Brian.

I recommend CD Writer Suite from Anodyne Software.
It does all you nead and can handle the main file format (RockRidge,
ISO...).
And it's more affordable than Soundpool's software.
You can get it directly from Anodyne Software or from Europe Shareware
(Espana & France).

Hey Greg. You did a heck of alot in a very short period of time. As a
very, very, very late arrival to the ST scene, like say 10 years after
its true American demise, as many in NA might argue the ST was dead in
1988. You managed to pick up an old computer and enjoy many things
alot of the original ST users never got to know existed. So really my
hats off to you. Your last line summs it up completely.

Fact is, I know of few people who would learn so much about an
obsolete 10 10 year old piece of equipment. I know plenty of long time
ST users who haven't bothered trying to get the internet working on
their STs.

The ST is my hobby too.

I am just not through with it yet.

See you later, in about 5 years, you should be ready to play with a
Falcon;-).

Later Brian.

Hallo Mark!

MB>and 2 are there any freeware replacement desktops avaliable.

Well, you could go for Gemini 1.a. Rather old and with some limitations (can't copy or show *NIX file permissions), but otherwise still working on any Atari system. Shareware, but with no fee nor registration required.
I don't know if other than german resource files are available, though.

To be able to use NVDI with then Nova perhaps? ;-)

> NVDI and NOVA are made for each other, the NOVA card in general performs
> better also when used with NVDI.

This might be true for ET4000-based Novas, but if you want to use NVDI on
Mach64-based Novas you must first run Nova VDI, then NVDI with disabled
screen-drivers. However, if you want to boot without the Nova but just
plain NVDI, the screen-drivers must be activated again.

> That's why Papyrus' *.DOC support is such a selling point. It's an issue of
> practicality, not a "conspiracy against smaller platforms" or "blind leading
> the blind" sheep mentality.

What standard? I mean why this happens only in computers industry? I
mean in stores there are labels and infos in few languages. Manuals for
Hifi equpment, washing machines, bla bla are in few languages also in few
writings (such as japanese, or cirilic) Name any business xcept computers
and ull see that selling means to be understood anywhere anytime.. Also
main panels, controls varies, car industry sell cars with steering on
right or left...

Now, why html editors and buliders can not add for example ALT tags to
pictures and links? It could be done automaticaly.. Why ppl dont use
interchangable formats? And why html writers kinda refuse to add few
simple links to most important part of the info? Im subscribed to few
astronomical pages, to nasa jpl news, and i get all info i need, in simple
ascii.. I dont say ascii only should be used, im saying ppl/companies
behave bad, and that happens only in computer business, in any other area
companies try to prepare comercials, manuals. product versions for
specific market/area, cause that means to sell more, and that is also
practicality..

Ops i need to correct myself, i meant mostly software industry with
computer industry...

Second that. I have two, one in my Falcon/AB running MiNT/MiNTnet, and one
in my TT running MagiC/STiNG. Haven't had a single glitch the 8-9 months
I've had them.

> For my uses the TT almost matches my P-133 pc. I use the pc mostly for

I'm glad I have an Afterburner :-) Still the fastest, and very, very
reliable (atleast in my Falcon, and since I removed the Nemesis.).

> What standard? I mean why this happens only in computers industry?

This happens in more than just the computer industry. It happens any time anyone or anything needs to communicate. If two people from different countries need to talk, one or both need to learn a common (or standard) language. In the music industry, MIDI became the standard for keyboards to communicate (and later computers as well) even though there were other methods possible. And later General MIDI and the Standard MIDI File format became the standard for saving music data. These are just a few examples. It's the same with computers. Any time you need to effectively exchange any kind of information between different machines, a standard has to be agreed upon, or at least evolve into the most commonly used format. Normally it's the most widely used format that becomes the standard.

> mean in stores there are labels and infos in few languages. Manuals for
> Hifi equpment, washing machines, bla bla are in few languages also in few
> writings (such as japanese, or cirilic) Name any business xcept computers
> and ull see that selling means to be understood anywhere anytime..

This is a bit different. To sell something means that you must adjust your product to match the standards of the local areas you are selling to. If you're selling to Japan, hopefully your product will include Japanese instructions. If you're selling to the United States, you'll most likely include English in the documentation. The more places you sell to, the more languages you're likely to print the documentation in. The reason manuals

and such are often in multiple languages is to cut the printing costs of making different versions of them and having to make more than one language template.

> Also
> main panels, controls varies, car industry sell cars with steering on
> right or left...

Again, this is different. Where controls are situated depend on the country in which the car is being sold. In the United States, you don't find cars anywhere with the steering wheel on the right side, because that's the standard in this country. That standard is different in various European countries.

> Now, why html editors and buliders can not add for example ALT tags to
> pictures and links? It could be done automaticaly..

True, but this is a different idea than a standard. This is just cutting something out because you think it's unneccesary. Most people think everyone must be using a computer capable of viewing pictures (which most people are). They don't know that there are a few that can't. And even the ones that do generally don't worry about it, because the extra time spent typing isn't worth an extra 1 or 2% increase in who can see their site.

> behave bad, and that happens only in computer business, in any other area
> companies try to prepare comercials, manuals. product versions for
> specific market/area, cause that means to sell more, and that is also
> practicality..

Once again, it all depends on the industry and location. In the "real world", things are generally sold to local markets by both local and international companies. This means that they have to cater to the needs of the specific markets, which can be different in each location. In the Internet business, things are a little different. Instead of focusing on local markets, you are focusing on an international market. You have to be able to reach the widest audience, the way the largest percentage of them wish to be reached, with the least amount of resources spent (including time resources). And this project must be as multimedia-like and stimulating, because that's what the avaerage person is attracted by. Otherwise you will be outdone by other companies trying to reach that same audience. Most people would rather look at flashy graphics and animation than read a screen full of ASCII text.

> Ops i need to correct myself, i meant mostly software industry with
> computer industry...

Software companies also need to do the same. Most people would rather see a program that they could just plug in, and all the formats are familiar, and

there is no need to tweek any files with text editors, or read heavily technical documentation to figure out how to work things. So standards have basically been set, with the heaviest bias toward the PC domain, since that is what more people world-wide use and are familiar with.

Well, I was referring to the constant negativeness, and I would never have said the above if what we're talking about happened once or twice. What gets to me is the fact that no mention of "new projects" for our platform passes without negative comments of that kind.

>
> Isnt this group all about an exchange of opinions.

I agree with that.

>
> Besides, perhaps it is really crap and youre to biased to see any
> different, this doesnt make everyone else wrong does it?.

Yes, perhaps it is pure crap. But if it is, I would like to hear the reasons for ones opinion, not just sleezy comments. And yes, perhaps I'm a bit too optimistic. But I'm not stupid, I am fully aware of our situation, lack of software and all that. I don't think anyone still using Ataris or clones needs thousands of lectures on this matter. No need be negative just for the sake of being negative.

Derryck Croker wrote:

> Are you absolutely sure that the problem is due to the software? Can you print
> to it from other software via GDOS?

100% sure??? No, but 99% sure. The printer is not detected during boot up with or without GDOS, so if it's not found, it can't be used. But when I use my normal boot setup, NVDI to replace GDOS and Geneva/Neodesk, I can print fine from Papyrus. Calamus's native driver (not the VDI driver which would use the NVDI printer driver) also prints fine. I also use Harlekin and Edith in the Geneva/Neodesk installation, but they are not NVDI aware. Thus they do not print either. Nor will LDW Power, which I think should since it does support GDOS/SLM printing. But I've not taken the time to troubleshoot these non printing problems.

That's why I think it's a software problem.

OK then.

Just to clear up my _obvious_ confusion please quantify your statement
below.

"If my Veloce 020 failed, would my machine be repaired and returned, or
would it be exchanged for something technically inferior?."

If a reasonable explaination is given then i will stop posting. However,
using your
usuall get out clause of a hypothetical question is not good enough. You
have
already stated elsewhere that you imply wrong doings to the group based upon
what you believe is fact.

If you are interested in ending this hostility then post your explaination.

Dave

Yes it helps but it matters little. a Stock 32 Mhz TT is still got a few more clock cycles per second than a 486-25. The instruction set on the 486 is also just plain horrific (Yes I do write low level code on a regular basis, I know this as fact). If anything will slow down a TT it'll be sloppy coding, nothing else.

Exactley NO DISCUSSION. You claim to have this and that. POST IT.
If you call someone a CHEAT, CROOK etc then it is up to you to provide the proof. Ater all Barrie has asked many times for you to post it.

> Coming foreward supporting Steve
> was enough to revoke Barrie... take a good look at the posting, and then

I have watched sweet imply wrong doing that is loosely based upon his supposed fact. Mr Lai did the same. Did i say that it was posted to csas? (maybee i did but i can't be bothered to check). However, all i wish to show is that when sweet wrote

"If my Veloce 020 failed, would my machine be repaired and returned, or would it be exchanged for something technically inferior?."

That it was based upon a story by lai, that he used in February against Barrie. Once again a made up story. Come on Lai post your mail to the group.

You haven't been telling stories have you??????????

>
> >sweet is the one with a problem. We can all tell what he implies but he

> internet. Using abusive language doesn't help at all in getting ones
points
> across, most of the times it turns out to work counterproductive, as been
> shown in this thread....
I don't really give a shit if you don't like abusive language. It got your
attention.
If you don't want abuse then don't give it. You are an opinionated liar and
i for one have had enough of you. You prove what you are saying. If you
want i can always start posting against you all the time so you can take
action against me. You see pillock calling you *nasty* name is not Libel.
However
if i called you a crook - who knows?

>
> >I will gladly go back to reading the group and posting occasionally in a

damn
> thing so that the English speaking Atari community can use it to their
best
> advantage. How's that for making up to the group for having to download
all
> my "useless uninformative blablabla" last month ?
>
And how many here really give a shit. Up yourself again?

If you had posted in a reasonable manner that was wiling to discuss the
problems
then i would have been reasonable in my reply. However, you have once again
taken the superior view implying that you are totally in the right. I think
this will
continue for a long time.

Dave

285. anybody remember Jim Kent

Newsgroup: comp.sys.atari.st
Date: 2001-06-06 02:13:21 UTC

Message-ID: <pkienle-BA801D.21132005062001@jetsam.uits.indiana.edu>
Source record: 45050

Just thought I'd share this:
Jim Kent was the programmer who produced CAD 3D and Sculpt on the ST a long long time ago. Very innovative software for the time....

Apparently he was the major player in the software which tied the Human Genome project together.

Um...

Actually, Jim Kent was the programmer for Aegis Animator ST (later AniST) and
Cyber Paint. Tom Hudson programmed CAD 3D and Cyber Sculpt.

From: Tom Brady <Tebrady@mediaone.net>
Message-ID: <3B1DBB3C.5AC74B6D@mediaone.net>
Source record: 45057

Hi all,

I just got a new 1040 STe (first time ST user) and I have a mono monitor. I'm using this for MIDI but I don't really *need* to use it for just that... (could always play a game). I've tried running the signal through an old 2600 switchbox on my TV but no luck. What do I need to get the damn TV jack to work?! Thanks!

If you choose to email your reply please email to:

Erm not quite. Jim Kent was responsible for Aegis Animater and Cyber
Paint on the ST as well as ZoeTrope on the Amiga. Which was simply
CyberPaint for the Amiga.

Tom Hudson created both Cyber Sculpt and CAD 3d. The Cyber Sculpt
modeler was one of the best modelers on all platforms for quite some
time. We continued to use it up till 1993-4.

Cyber Paint was an excellent little program that worked wonderfully on
the ST.

Too bad it wasn't updated, or taken over by the phase four crew,
lexicore stuff, when they were active.'

Tom,
A couple of thoughts. Firstly you may need to unplug the mono monitor. When that is plugged in it changes the line sync to a rate you TV can't understand. Secondly the TV output jack is RF so it should just go to the TV antenna/arial socket and does not need any other converteer. If your TV has RGB/SCART inputs you get a much better picture from those. You need a lead which goes into the monitor socket on the STE. Instrctions for making a lead for these appeared on here a little ago. Try searching the list archives at groups.google.com (was Deja News)..

292. Question about hdd in Mega St 4 ?

Newsgroup: comp.sys.atari.st
Date: 2001-06-06 08:25:56 UTC
From: MrSiwy <psion5@kk.net.pl>
Message-ID: <9fkpe6$4do$1@news.tpi.pl>
Source record: 45062

Hello everybody,
I'm new on this group so at the beginning all the best to all.

I need some technical information about hdd in ST/Mega ST.

1. What is the maximum partition size which is visible by pure TOS 1.04 ?

2. Any possibility to make bigger partition than 39MB ?

3. I have ICD AdSCSI Plus interface and software from ICD 6.5.5 ver, the disk with more than 1Gb is visible but when I make partition bigger than 39MB - is not visible. Partition C: is visible and accessible even if the size is 300MB but the rest of the partition is not. When I use autoinstalation - disk is partitioned in right way - from C: to P: but the sizes are not satisfy for me (all drives has 39MB capacity). When I run for example Kaos 2.0 all partition are visible but in a pure TOS - not.

Can anybody has any suggestions what to do, or what I'm doing wrong???

Any answers are welcome.

regards

Slawek

295. [ANN][ES] General public MagiC SDK

Newsgroup: comp.sys.atari.st
Date: 2001-06-06 09:26:59 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <3b1e035610719d3@free.fr>
Source record: 45065

Hi all,

Following a lot of requests, Europe Shareware now offers the MagiC SDK
to all Atari users without any restraint. The kit includes:

ï¿½ either MagiC Atari or MagiC Mac or MagiC PC, with paper manual
ï¿½ The GCC kit
ï¿½ GCC Shell, registered version
ï¿½ Ressource Master, registered version, with paper manual
ï¿½ Windom libraries with its printed documentation (200 pages)
ï¿½ EZ Edit text editor (with syntax "colourisation")
ï¿½ Many development libraries
ï¿½ Many development tools

All this for only 99.00 Euros !

(reminder: for active developers the price remains 75.00 Euros).

Have a look at the MagiC SDK page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Best regards,
P. Ricard (ES)

32 MB is usable, better said. You can see partition, but can't work
with files placed beyond 32 MB.
>
> 2. Any possibility to make bigger partition than 39MB ?

Why 39 MB ? You can use Bigdos or Hddriver. Then limit is 2 GB. With
Mint is possible to use FAT 32 too.

> example Kaos 2.0 all partition are visible but in a pure TOS - not.
>

Obviously Kaos has some DOS extensions.
TOS use FAT16 partition system, what means that can adress 65536 sectors,
and it gives limit of 32 MB.
Hddriver increases it by using bigsectors, up to 32 KB.
Normally FAT16 use diverse cluster sizes to make possible adressing whole
partition (up to 2 GB) with 16 bit FAT.

Does this simply remove the "focus" from the running accessory and activate another process/acc, or does it kill it?

(MultiTOS AES 4.0 and 4.1 will kill the process/accessory if one Control-clicks the process name in the menu)

Pardon my ignorance if this has been discussed earlier, my newsfeed has been a bit flaky lately.

Care to get involved into MiNT development and cleanup the mess?

Judging from other people's comments, MiNT-Net is rock-solid
using the Hilgarte adapter, while on my Riebl it never has been.
The only conclusion is that the Riebl drivers are a mess, which
is sad, given that everything else works reasonably well. Too bad
Torsten Lang has stopped upgrading his code...

It's been a long time since I used an Atari laser printer, so I can't recall
if it's meant to announce itself at bootup or not. I do remember the cautions
about having it and any other DMA devices (that would mean a Supercharger or a
Link-type ACSI-SCSI converter) plugged in in the right order.

However, it seems to be a software problem which has bitten you as you
suggest. :-(

As I got fed up with my Atari machines I moved up to the next Atari
level and kept the previous one. Now I am glad I did as I have
everything from the 2600 to the Hades and I am very happy.

>which again sets you back nearly as much as a Hades. ;-)

Yes, that had to be. The regular Amiga is nice, but is not much better
than a STe. Right now, if you want speed, the Hades is the best bet. I
think Greg mentioned he wanted to get a Mac, which is not too bad
either. Then he could get MagicMac and run all his favorite Atari
programs. But if I was in his shoes, I would wait for the net TOS
computer to come out, then compare it to the Hades and make my decision.

Hi Bernd,

>I test a program on my falcon and this program have some problems, when
>the NOVA is installed. I must run this program with and without the NOVA
>driver to find the problem and the author can fix this problem.

I've placed NVDI just behind STA_VDI in the Auto folder:

EMULATOR
MENU
STA_VDI
NVDI
XBOOT

MAGXBOOT
etc...

The first four progs are always active, I've put the file flags to write-
protected. Write protected files are automatically selected in XBoot. So
when removing that flag, Xboot will not lounch it, since in the set it
isn't marked as being active...
By toggling the write protect flag, you can easily enable/disable NVDI,
without having to fiddle with the XBoot sets.

This only works with the Nova drivers enabled, see my other posting for a
possible solution with disabled Nova driver...

Cheers from Belgium

>web site in order to make the site harder to use again because some guy
>with an Atari wanted them to.
Never ever mention you use an Atari, in general these firms will not handle your complaint(s) seriously. A little white lie goes a long way... ;-)
For example someone running MagiCMac on a G4, should avoid using the word "MagiCMac". Telling them that with the latest Mac G4 you have difficulties accessing their website is much more effective... forget to mention CAB or MagiCMac.

>Anyway, like I said, we've got to just bear down and get a working HTML

>we've gotten because we've sat on our butts and complained about advancing
>technology.
I agree, well, it's difficult not to agree...
But this brings us back to a discussion which was held here a couple of months ago. The Atari computers used by the majority of the people here isn't suited for this.Unless we all throw out our Atari and buy a fast Atari clone, this software simply wouldn't run or be much too slow.
And then there's still the question who is capable of writing/porting the software. The only browser which is currently still further developed is Adamas (Draconis Pro) and after countless updates it still isn't as good and reliable as CAB is.

>The moment we insist something isn't necessary (like Javascript)

>it's probably the most frustrating part of being an Atari user.
Maybe we should face the hard facts, and accept that surfing the web with a Atari is not the brightest idea... no one here demands a program to watch DVD films because they know the hardware isn't capable of this. We should accept the simple fact that a 68030 has its limitations.

Cheers from Belgium

Hi Jo Even,

>This might be true for ET4000-based Novas, but if you want to use NVDI on
>Mach64-based Novas you must first run Nova VDI, then NVDI with disabled
>screen-drivers.
Yes I know this, this is the standard procedure for Nova cards with a
ATI Mach32 or Mach64.

>However, if you want to boot without the Nova but just plain NVDI, the
>screen-drivers must be activated again.
One solution to this problem is to use two different GEMSYS folders, for
example GEMSYS and NOVASYS, one would hold enabled NVDI screendrivers while
the other one would hold the disabled drivers. You would have to keep two
different ASSIGN.SYS files also ofcourse. In XBoot a seperate set should be
created, which would load the assign file for the folder containing the
enabled NVDI drivers...

There are different solutions to fix this problem... the one given here is
just one example, it works for me, but someone else might find it rather
cumbersome...

Hi Sylvain

>I recommend CD Writer Suite from Anodyne Software.
>It does all you nead and can handle the main file format (RockRidge,
>ISO...). And it's more affordable than Soundpool's software.
Sorry but I disagree.
Just compare the features of both packages and it should be clear to anyone that the Anodyne software is a very basic offering... the only thing speaking in it's favour is the support of long file names.
Someone looking for a program that is able to make a backup from his harddisk will be very pleased with the Anodyne CD Writer Suite. But anyone wanting more will soon find out that for serious stuff the only solution is SoundPools CD Recorder Pro.

For example:
How do you create a Mixed Mode or CD Extra CD with the Anodyne package?
How can a copy be made from a Mac HFS format CD? Can the package make backups using the archive bits (easy backup, space saving)? What about a copy of a sampler CD ?

I agree that SoundPools sofware is more expensive but think this is normal, Calamus costs more then Papyrus also... you usually pay for what you get...

Cheers from Belgium

I had some troubles on my old ISP.. Now iwe moved and Riebl is rock solid.. Im a lot on internet, transfer not so little as well, and i this year and a haf i had no probs at all.. Only Plip gives some troubles, bit Ozk fix it, and last few months there is no probs. ONLY riebl related problem is loosing MAC addres once or twice, because of bad battery.

Anybody tried this with True-types such as supplied with my
DeskJet printer, for instance, which have an underscore at the end
of the filename? ISTR I tried the ZIP trick and it didn't work.
Eventually Derryck extracted then for me on a PC. As I recall,
there wasn't all that great a difference in size, so it presumably
wasn't zipped (though it may just have been a very low compression
ration).

Very true! The only two times when I've mentioned Atari and have been shown
respect was when I was buying my Mac, and the guy (who used to own an Atari
as well) thought I was getting rid of the Atari altogether in favor of the
Mac, and when I told a PC salesperson that I needed parts to do an
"electronics project on an 'old' Atari computer" when I was doing a project
on my Falcon.

This is true. The problem is, we need these "high-end" browsers if the
high-end Atari clones are to be worth getting.

>> The moment we insist something isn't necessary (like Javascript)

> accept the simple fact that a 68030 has its limitations.

Yep. This is true. The 68030 has definitely seen better days! Hopefully inexpensive upgrades will be made available (like CT60 or Tempest - maybe...). This would at least allow a larger percentage of people to be able to own a higher-end machine without spending thousands. Then maybe a good full-featured browser will be a reasonable request? I don't know... But I'd still like to see something at least a *little* better than CAB come out sometime soon.

The Riebl works okay, as long as the next machine is at least
15ms away, but within this LAN all machines are closer and the
Riebl drivers regularly die. I can download impossibly huge
files form the Net but, if I try downloading the same file from a
machine within my LAN, it crashes the Reibl drivers and the only
cure is to reboot.

I think my little tool is easier to use: Just run it after sta_vdi and
before NVDI. It will automatically disable NVDI's screen-drivers if
sta_vdi is run, and enable them otherwise.

Run XaAES from mint.cnf with the -fvideo parameter.
I dont have a falcon. But happily Ronald Andersson has helped me to get it
working. Unfortunately I forgot to ask him which values for -fvideo are good ones.
Somehow I have the feeling that somewhere in the centscreen documentation
these values can be found. Dont search for the word fvideo! That is a private
XaAES invention. :-)

Hi all,

Just tried to figure out the innards of my system after trying to take it open it up proved to be hell (THE HEAT SHIELD! TIPS?) I also basically wanted to see which TOS I had and how much RAM was in there.

I had a TOS ERROR #35. I've had those a few other progs as well, but thankfully nothing serious (mostly games). What does this mean?

Any alternative programs?

Thanks,
Matt

326. ? 'bout LOGIC 2.5 Chord Font, Symbol Font (Music)

Newsgroup: comp.sys.atari.st
Date: 2001-06-07 03:22:32 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3b1ef41f$0$18899$272ea4a1@news.execpc.com>
Source record: 45092

Hello,

A while back I got an upgrade from LOGIC 2.01 to LOGIC 2.5

Chord Font and Symbol Font were not included in upgrade package.
I am using them from LOGIC 2.01

Does anyone know if these Fonts were upgraded in the "full" LOGIC 2.5
package?

Reason: When I type in chord symbols (when using a normal text font as
stated in manual) the flats and sharps vary.
Example: Dbmaj9b5 - The first b is a music symbol (flat),
The second b is a text symbol (letter b).
I'd like the 2nd b to be a music symbol, not text.

thanks,

ken

327. FS/T: Brand New Atari Jaguar Items - New Game Titles Added

Newsgroup: comp.sys.atari.st
Date: 2001-06-07 04:14:17 UTC

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 6/06/2001
- Sold/Traded Items Removed

I have a limited amount of brand new (sealed) Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping. Overseas shipping is available.

Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar game system.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - (Limited Supplies)
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $10
- Spare Controller $15 (Limited Supplies)
- AC Power Supply $10 (Limited Supplies)
- RF Switch Box $5 (Limited Supplies)

** Atari Jaguar Games - New/Shrink-wrapped**
==========
Due to all the game titles being in short supply, all titles with the

exception of CyberMorph are available only with the purchase of a Jaguar
game system.
- Checkered Flag $15
- CyberMorph $5 (No Box)
- Kasumi Ninja $30
- Tempest 2000 $40
- Troy Aikman Football $30
- Wolfenstein 3D $30

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues
12 thru 20

But I already have the Soundpool software and I'm quite satisfied
with everything except the missing LFN support. So to pay the price
of Extendos Gold + CD Writer Suite for this single feature is not
that cheap although I'm considering it.

Vague, you didn't mention which Atari computer you're talking about. Anyway, the usual way of disassembly on the ST(E,FM) range is to remove all the screws from underneath the computer. Lift the top a little and remove to the right, clearing the floppy eject knob.

Then unplug the floppy drive and remove it, unscrew the PSU, unplug and remove it, take out all the screws from around the motherboard. Slide the motherboard towards you a little, and take a pair of pliers and straighten all the tabs which hold top and bottom shields together. Lift the top shield off. Job done.

Do they make a cable that goes from the RCA jack on the Atari to a
standard cable (coaxial) input on a TV? I've never seen one like that
before.....

Hi Guys.

I am testing my troublesome Newserver. It is apparently been fixed.

Let me know if you see this post, both here and via email.

Thanks Brian.

If I'm not mistaken, you can use an old game switchbox, like the ones that came with the Atari 2600's, and use a terminal adapter that has screw terminals on one side (which the box connects to) and a coaxial connector on the other to connect to the TV. They may now even make the boxes with the coaxial connector built in. If you're in the U.S., any Radio Shack or equivalent store should carry both of these.

My main two problems with "dead Lynxes" is the power connector. The pins break loose. Resoldering fixes that. This can keep batteries from working two.

341. Editor/librarian for Korg DS8 synth?

Newsgroup: comp.sys.atari.st
Date: 2001-06-07 18:58:47 UTC
From: sonik@wearelondon.fsnet.co.uk
Message-ID: <9foit7gej1@newsg1.svr.pol.co.uk>
Source record: 45107

Hi folks

Just a line to ask if anyone knows of a dedicated editor or librarian or even both for Korg's DS8 digital synth. Also, anyone know where I can download some decent sounds for it: the factory presets are no great shakes!

Cheers :)
Al

ps by the way, any other Atarians looking for DS8 sounds, the factory sounds are available for download at Korg's site (www.korg.co.uk) in a zip file.

I have two Riebl-cards myself, but have never been able to get them
working. The best I've managed is to ping my TT from my PC, but as soon as
the TT receives a packet it crashes. I would be very interested in more
details on your setup (kernel, driver etc.)...

Yea, the "order things have to be plugged in" plagued a lot of people.
IIRC, normally the SLM had to be last in the chain. I have only one
other DMA device, so I've tried it both ways with no luck.

349. Misc ST Items and Books FS(USA)

Newsgroup: comp.sys.atari.st
Date: 2001-06-08 01:44:04 UTC
From: fmhcom@operamail.com
Message-ID: <E5WT6.927$Ey1.5966@newsfeed.slurp.net>
Source record: 45113

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.

Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $40.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

680X0 Programming by Example. Published by Howard Sams & Company.
An Assembly Laguage book for the 68000, 68010, 68020, and 68030
line of chips. Has a ton of code and illustrations.

The Atari Assembler. Published by Reston Publishing Company.
A very illustrated book covering Assembly on the Atari 8-bit.

Atari Roots. Published by Reston Publishing Company.
A guide to Assembly Language for the Atari 8-bit computer.

Atari ST Application Programming. Published by Bantam Computer Books
A nice C programming book with lots of examples.

The Atari ST Book. By Ralph C. Turner.
Tips, Instructions, Secrets and hints for the Atari ST line
of computers.

Atari ST GEM Programmer's Reference. Published by Abacus Software.
A complete guide to GEM programming with C.

Atari ST Internals. Published by Abacus Software.
Book covers every processor, chip, component, and register
in the ST all in Machine Language.

Atari ST Programmer's Guide. Published by Weber Systems.
Focused towards the beginning ST User/programmer.
Covers BASIC and LOGO

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Compute's Atari ST Machine Laguage Programming Guide. By Compute Books.
A very good book on Assembly for the ST.

Compute's ST Applications Guide programming in C.
A clear and comprehensive guide to writing Atari ST applications
in C.

Compute's ST Programmer's Guide.
Covers BASIC and LOGO.

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples.

Intermediate and Advanced Atari ST Subjects. by Ralph C. Turner.
Covers topics like hard drive management and optimization,
Running IBM programs on the ST, Connecting SCSI devices and more.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

Programmer's Guide to GEM. Published by Sybex.
GEM Programmers guide in C.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
Sept 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

This is done with boards from 3rd party developers.

> Also do you remove the old 1MB chips off the old SIMMs cards and
> install the new chips, or buy the chips and cards as a unit ???

This information is for the Atari board only, remove the 1 MB chips and
replace with
4 MB chips. For complete burst mode function use nybble mode RAM only.

> Could you give us a idea of the cost of the 4MB chips ??

When I bought my chips in 1995 about $400.00 dollars.

Hiya,

try this one

http://welcome.to/taf

that should work, there's another one at atari.org I think that points to the same site as far as I know. TAF is still going with a small group of regulars mostly. Aside from one person making, ahem, "caustic comments" its going ok.

I used to use the tv before I got both colour monitor (also have mono)
remember to make sure the mono monitor is unplugged when you use tv. The
tv is used in colour mode which won't be available when a mono monitor is
plugged in.

Source record: 45120

Hi all,

I've got yet another question (actually 2)!! I'm planning to get TOS 2.06 soon since I can't get sysinfo.prg to figure out what version I've got. Which would you all recommend for stability (use in MIDI studio) 2.06 or 1.62?

Secondly, my monitor port seems to be loose, like how Nintendos get after a long time... if you bump the plug on the chord, it'll lose it's connection and restart or whatever. Can I fix that by simply resoldering the monitor port or something? Any hints on how that's done (and how to get the heat shield off without breaking anything!!) I'm not a solder master..... yet

BTW, I have a 1040 STe. Thanks a ton! (Even some links to stuff like this would be good)

Matt

I think you should add a note to such lists saying that drives not
listed will most likely also work. Otherwise some users will think that
only the drives in the list can be connected, which is definitely not
the case.
I have got a lot of feedback in the past with respect to whether drives
work or not. Fact is that I cannot remember any SCSI drive that did not
work. If something was wrong it was always due to wrong termination or
bad cables.

an STE could mean either tos 1.4, 1.6 or 1.62. 1.4 is rare in STEs, tho. It sounds as if the sysinfo software is dodgy. Try booting of the disk only with no accs or auto prgs, and see how you go. As far as your monitor port goes, yeah, resolder the pins on the PCB. You may need to replace the port as the clamping force on the pins is more likely the problem.

>>problem?.
>
>If I only knew that. Since someone else mentioned mailing them about
>LFN support I thought sending them another mail about that topic
>would help but it doesn't seem so. But maybe if some others would
>do the same...
I remember reading in the maus.atari.software newsgroup someone posting
that SoundPool doesn't see the need for LFN support in CD Recorder Pro.
A statement like this makes you wonder....
So far no one has managed to convince them that LFN support is a feature
which simply *must* be implemented in an application which calls itself
"professional".

As for being extremely easy to implement... I'm not a programmer, so I
don't really have a clue, but I have very strong doubts that it's easy.
Nothing is easy, otherwise the Anodyne package would now be much better
that the SoundPool package, which after all hasn't changed or seen
anything new implemeted to it since 1996... and that's a very long time
in software terms.

Cheers from Belgium
Dennis

Hi Tom

>I had a TOS ERROR #35. I've had those a few other progs as well, but
>thankfully nothing serious (mostly games). What does this mean?

<SNIP>
TOS Error #35, probably the most common error alert that is not self
explanatory, happens when a program you are trying to run has somehow
been corrupted. What it means is that TOS can not find some magic
numbers it expects to find either at the beginning or at the end of
the program file. This error is usually attributable to operator error
(as in trying to execute an archive or text file as a program), or to
bit rot.
<SNAP

If you load from disks it could mean that these are slowly detoriating
or that your diskdrive has had it's best time. When loaded from harddisk
it could point to a termination problem.
There are several possibilities. Download a new version of Sysinfo, and
try to run it... from disk and from harddisk, see what happens and
report back...

Cheers from Belgium

Hi Gerhard,

>> This is essentially true. Without an update, 600 dpi is about the
>> best we can hope for. Fortunately, many printers are backwards
>> compatible, so at least they work.
>
>Well. Isn't 600 (or 720 at Epson printers) enough ? At least I'm
>satisfied with the CD Covers I print with my Epson 760.
One could answer that it's never enough...
DPI are just a way to define the possible resolution of a printer, it doesn't tell you anything about the final result on paper. Compare the results coming from a 24pin printer 360*360, laser printer 300*300 and inkjetprinter 720*720 and most certainly you'll go for the laser...

The point is that since NVDI isn't upgraded anymore, people buying a new printer have to be extremely carefull not to end up with a printer that is only partly or not supported at all. The HP-930 for example seems to work with the NVDI drivers, but only prints in colour at 600*300 DPI, meaning that it is not capable of printing "photo quality", well not in colour anyway. One doesn't buy a coulour printer to end up with grey-scale images....

Another point is that the NVDI drivers IMO aren't all that good as some people would like us to believe. I never realised what my printer was capable of, untill I saw a similar model doing its thing on a PC. The way in which images are dithered under NVDI is a far cry from what is produced on even the most humble PC with a matching printerdriver for Windows.

NVDI doesn't only need to be updated with drivers for the latest printers which take full advantage of their features, but needs to be reprogrammed so it can calculate and output new dithering methods, this is 2001, NVDI gives a print quality which was acceptable in 1995... even if a new printer would work flawlessly with NVDI, seeing the results which are produced on paper will be quite disapointing.

In my experience when it comes to printing pictures at photo quality nothing beats ImageCopy, but even this program is very mediocre when compared to what can be achieved on a Mac or PC...

Cheers from Belgium

>
>I think my little tool is easier to use: Just run it after sta_vdi and
>before NVDI. It will automatically disable NVDI's screen-drivers if
>sta_vdi is run, and enable them otherwise.
It certainly is !!!
Thanks.... another little jewel for the crown :-)

As an alternative to your program people using ASH Scripter can write a
small script that renames the driver(s), something like:

```
files.rename("C:\\GEMSYS\\NVDIDRV8.SYX","C:\\GEMSYS\\NVDIDRV8.SYS");
```

To disable the driver(s) back again, a similar script should be written,
your program is still easier to use ofcourse, but the script can be usefull
when the drivers are not at their usual place ie. C:/GEMSYS...

Hi,
The reason why I started to make this special CAF-HD list available, is
because Cubase Audio is so d**n picky - and many drives that work with the
Falcon in every other respect do have problems when it comes to Cubase Audio
:(
I have personal experience from many of the drive models in the list because
I had possibility to test a lot of drives where I worked previously, but
such a list soon becomes obsolete because of the progress in models - so any
new additions to it are very welcome...

Best regards,
Claes

```
AtarIRC v1.18 is now available.

It can now handle servers which implement a double ident check
at login. Also some misc bugs were squashed.
See docs for full details.

I don't know if that's quite true. I know one of the beta testers for
Anodyne, and he is always testing out some new feature.

TUWTCP is *really* worst case:

I have a working SMC Ultra card with a selfmade adapter in my TT, with the
"only" drawback being that there are only TUWTCP drivers at this point.

After hacking TUWTCP quite a lot, I got the whole mess working - until I
upgraded my 2.0.* linux kernel series, when it stopped working again due to
incompatibilities in the TUW IP stack. At that point, I decided to not put
any more work into TUWTCP. It was a nice piece of software when it was
written, but is IMHO broken beyond repair by current standards.

Splitting the St isn't very hard.

Flip the machine upsidedown and remove the 6 or 7 screws. Slightly
loosen the 3 disk drive screws.

Turn rightsideup and gently lift the top cover from the lefthandside
being careful with the disk drive button.

The keyboard is held in my a plug to the right of the motherboard,
unplug this. Then remove the 3 retaining screws for the disk drive in
place.

Remove the power supply cover and remove the 2 screws on the power
supply, the power supply can then be carefully lifted out.

The motherboard shielding is held by lots of tabs. Using a pair of
pliers straighten all the tabs. The top shielding should now lift off.

>
>I had a TOS ERROR #35. I've had those a few other progs as well, but
>thankfully nothing serious (mostly games). What does this mean?

TOS Error #35 can mean that you are trying to run a program that is
meant to be run in the AUTO folder (which is a tos program)!

It is also possible that a virus can cause this error, as these nick
vectors of the system that are needed elsewhere. Also if you have run
another program prior to this, it is possible that this can cause this
error.

So try a cold reboot, even wait a couple of mins with no disk in the
drive and run from the desktop. This way you should be able to eliminate
the virus and old program residue.

Very easy to convince them,

Soundpool is from .DE right?

Just right them an email in german but with all the word truncated to 6
letters + ~1. In german it would be quite awesome as they tend to use
quite lenghty words. For example:

Heie Diskus~1 um den Haupt~1 folgte~1 vor allem im
Atari-~1, auch die Art der Einlei~1 zur Umfrag~1 und des Umgang~1
mit Milan rief zwiesp~1 Meinun~1 hervor. Inzwis~1 ist die Umfrag~1
beende~1 und wird ausgew~1. Um es vorweg~1:

There you go :)

I know that IBM made a differential SCSI drive which has a 50 pin connector
like a conventional SCSI interface, but was completely incompatible. Maybe
you accidentally picked on of these up? (IBM made most of their earlier
drives in both flavors.)

Just an additional note: that is not IBM's fault. The SCSI standard
specifies both single-ended and differential versions with the same
connector, so the user has to take care to get the right interface.

Other manufacturers also make differential-SCSI drives, so you have to be
careful with any kind of disk (and even tape drives etc.).

>2.06 or 1.62?

I have a 1040STe with 1.62 and it works fine for MIDI. I also have a
Hades with 3.06 and it also works fine for MIDI. I would assume that
2.06 is also ok. The choice is yours. You could get the piece of
hardware that lets one switch TOS roms by a flick of a button.

>Secondly, my monitor port seems to be loose, like how Nintendos get

I am not sure about this, but I would think a re-soldering job is what
you need and I would have it done by someone who is good at it.

Source record: 45155

Hello all,

I received an interesting email from a friend that says that Infrogames is changing it's name to Atari. I am wondering just this means in terms of support from them. Probably nothing, but who knows what will develope from this. The letter is below:

Atari Lives! Well, a rebirth maybe!

----- Original Message -----
From: Bruce Clarke
To: atari@yahoogroups.com
Sent: 08 June 2001 12:55
Subject: [atari] Infogrames to become Atari?

AtariNews has been unable to verify this rumor yet, but it is quite intriguing nonetheless. - Editor

http://homepage.tinet.ie/~morrikar/Stop-Press.htm

ATM Exclusive: 7 June 2001

It has come to our attention, that a decision has been made at Infogrames to change its name to Atari. This news has been confirmed by very reliable sources, and will come into affect before the end of the summer, or even sooner.

Sources indicate that the decision was made due to the lack of awareness in some global territories of the existing Infogrames brand, and that the head of Infogrames, Bruno Bonnell (Chairman & CEO) was very aware that the Atari brand would be a stronger and more recognisable asset for the company.

At this time, we do not have any other information as to the future direction of the company under the Atari brand, but it seems that all software published under the existing Infogrames brand will change worldwide to Atari.

Of course, if any of this information changes, we will update this page immediately. ATM and AHS only provide this information based on extremely reliable sources, and cannot be responsible for any errors or omissions at this time.

AtariNews is sponsored by Songbird Productions.

>
> I'l try to, but to be honest when i saw the remark i replied to i realy
> didnt see what the problem was, i honestly have never got the impression
> it was kicked just cos it was lying there convenient.

I donï¿½t think the problem is that there a negative comments, that is
normal.
What might get tiresome is if there are repeated posts in similiar
threads saying
over and over again that a project is doomed to fail and plain
rubbish. And I think
that is the case here. I am not too convinved xtos will be a success
and surely some
of the reasons for seeing things negative are justified, but I wish
the team behind that
project the best of luck. Pokeing fun at them in post after post is
not really constructive.

> I have heard negative coments yes, but lets face it, when do we actualy
> hear anything positive about anything in here, IMO, you judge something
> in here by the degree of negativity!!

Which perhaps is not an ideal situation. The forum is what we make it
really.

Regards,

Joakim

Why would Linux in any way affect your TUWTCP installation? Why would there be
any interaction between Linux and TOS (which TUWTCP to the best of my
knowledge runs on)?

>clearing that up.

A Minix clone which could be expanded and took advantage of more modern
processors. The Minix developers preferred to keep their system as simple as
possible. After all, it's a system for research purposes, not a day-to-day OS.

>Linux is a clone of Minix only in the sense that both are patterned

And I don't give a bloody damn. Linux was the one to fall over.

>ANY file system without journalling or a similar strategy is going to
>have problems when you yank the rug from under it.

You seem to have a very loose definition of journalling. None of the Amiga
FSes are journalling to the best of my knowledge, yet even the old FFS (not
related to the BSD FFS) is fully readable even when interrupted in the middle
of a write, and is self-validating as a background process. No-one in their
right mind would call FFS journalling, and then we haven't even mentioned SFS,
AFS or PFS, which survive interrupted writes just fine, without any need for
validation.

>Does this make ext2 "horrible"? No. It is a very robust file system
>under normal circumstances (as I say, no better or worse than other

>lose uncommitted data. It's just not as likely that file system
>metadata will be corrupted by the event.

Yours and my definition of normal circumstances differ a lot. Your suggestion
to buy a UPS is yet another symptom of the mini computer way thinking which

influences UNIX.

>(In fact, message passing servers in a microkernel can actually be very
>hard to debug, due to race conditions, zillions of ways to come up with
>deadlocks, and so forth.)

That's from the programmer's point of view. I can tell you that before I got
to know UNIX, I had no idea what a kernel was, because before that, there was
never any need for kernel maintenance, kernel modules, kernel recompilations
and so on.

>> Besides, OS
>> designers?

(stuff about finding an editor for a Korg DS8)

Cheers for your help Paul.

Myself and the DS8 have parted company! I got it for a knock-down price on Wednesday sans manual and it's not what you'd call easy to program without some explanation of parameters so back to the shop it went. Rather like meeting a lass, going home, doing the wild thing and then deciding she's really hard work after all!

Cheers

Al

The Anodyne LFN utility seems to use mkisofs.prg to generate the image file containing all the files that are passed to it for burning to CD - if you rename that prog with a TTP extender and call it with the command -help then you'll see that there doesn't seem to be any way for it handle the archive bits.

My point is that you still haven't by far explored the possibilities of the
platform if you're sitting with the absolute low-end. It's like deciding that
you've done all that is possible with a Mac based on your experiences running
a Mac Plus.

> So let's see, for the price well over a iMac (Speaking of the Hades and

How easy do you think it is to run old software on the Mac or PC? I'm having a blast here trying to install Frontier on a Windows machine. No way that it can be coerced into cooperation.
As for price, yes, I know that it isn't all that cheap, but that's running a niche platform to you. But it's not as though you have any other alternative if you're really into Atari.

In that case, you'd better be prepared to be more open-minded about expansion. Amiga users aren't all that concerned about backwards-compatibility, and if you expect to run anything on a 7 MHz A500, expect a wall of silence at best. If you're afraid of upgrades, you'd better stay with the ST, because you'll never find any other platform where you're not expected to upgrade every now and then.

Bollocks, Lonny. Mine runs at 68040/25, and in Commodore's old, inefficient
design at that. It still is perfectly usable, as long as you have a graphics
card. Does your neighbour have one?

I did't say it was not usable, he mentioned the hades and milan which is
the top end of the Atari platform. My comments are in regard to
speed only.

Sadly that is partly true. If someone saw an xtos proto-type
or some real evidence that it is somehow got problems, that
emulation of missing code is super slow, then I'll listen.
That would be real opinions based on real physical evidence.
Anyway, since owning a Hades I know first hand that Medusa
can produce a clone if they set their mind to it.

If by some chance it does appear, there might be some used
Hades machines up for grabs. If anything people should try to be
more positive or just leave the subject along. ;-)

Iggy Drougge <optimus@canit.se> wrote:
>
>Why would Linux in any way affect your TUWTCP installation? Why would there be
>any interaction between Linux and TOS (which TUWTCP to the best of my
>knowledge runs on)?

Because TUWTCP ignores some important parts of the TCP/IP specs, and thus
can't make a connection to a Linux machine (which my server is) which does
use some optional TCP/IP features that were probably not used in the days
when TUWTCP was written.

One such thing is the DF (don't fragment) bit in the IP header, which when
set causes TUWTCP to misinterpret and discard the whole packet. Linux sets
these by default.

I fixed that one, but there seem to be more, and as I said, after TUWTCP
failed again after the Linux IP stack changed its behaviour a tiny bit after
an upgrade (in a way that was permitted by the specs!), I lost the interest
to track down these bugs in the TUWTCP code.

That means if you want to use TUWTCP to connect to some old SUN running
SunOS 4.0.x, it will probably work :-)

404. Free ST520 + manuals + software + 2 printers!

Newsgroup: comp.sys.atari.st
Date: 2001-06-09 18:48:04 UTC
From: katmajid@hotmail.com
Message-ID: <2864f92a.0106091048.1f49722d@posting.google.com>
Source record: 45172

I have a pristine Atari 520ST with all the original boxes and manuals
from when I bought it in the 1980s.

- The floppy drive is not working.
- My cat chewed the mouse cord, so it has trackball.

Otherwise everything is in like new condition, clean & working (to the
extent that I can check without a good floppy drive).

Anyone willing to come to my place in Queens, NY and collect ALL is
welcome to take it. I loved this beautiful little machine, but I've
moved on and I have a space problem. I'd rather give it to someone who
will appreciate it than dump it out.

Besides the computer, here are the additional goodies:

- Epson 24-pin printer
- Daisy-wheel printer - Epson DX-10 (like new, in original box)
- Box of ST magazines
- Software (all purchased/acquired legally):
word processors: Regent Word II, ST Writer
DB Master One
Degas Elite
Aegis Animator
Maps & Legengs
King's Quest II
The Guild of Thieves
The Pawn
Rings of Zilfin
Land of the Lounge Lizards
a bunch of public domain & ST Magazine disks

Please note: I will NOT pack & ship; you must come here and collect
it. Also, whoever wants it must take everything -- I won't give it out
piecemeal. But anyone is welcome to come and see it before deciding.
It's first come, first serve.

Email me directly if you're interested: katmajid@hotmail.com

you are quite Djordje..

it has got nothing to do with the fonts you are using.

It's a problem that Papyrus has - and I'm sure Ulli knows
about it and so does Christian - but it hasn't got priority ;)

I'm having similar problems with Polish texts.

Let the MSWord people use the proper Unicode format when saving -
alas you loose all the formatting ;) - then Papyrus will have no problem!

gtx, Rein

407. More Atari-Midi Freeware: Keys!, Tempo Master MPE and KCS Text MPE

Newsgroup: comp.sys.atari.st
Date: 2001-06-09 22:58:48 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0106091458.6f48dc47@posting.google.com>
Source record: 45178

Hello All

MORE FREEWARE!!

Jeffrey Reid Baker, out of a chance coresponance has released to me several of his previous Atari-Midi programs. These include DR T's KEYS! a Composer/Step time Application with Algorithmic possabilities as well. Tempo Master MPE which allows you to tap out a tempo and more, and KCS TXT: a txt tool for Dr T's KCS program. He also has a selection of KCS produced "alternate" classical CDS of all the great master composers. I just created the page .

Link: http://sites.netscape.net/timconrardy/jrb.htm

KEYS! allows you to input scores in Step-Time. More so, it has an excellent Algorithmic generator which generates more or less "classical" sounding music and also scores it. While you play it, you can see what notes are "played" by the on-screen keyboard graphic. Quite nice.
I would call this a "Composer Step-Time Tool".

This should run on Steem (on a PC) as well.

His CD's are EXCELLENT as he sent me several after I ordered one. My fav is the LISTZ. Talk about excellent arranging and sound choices for his synths. On the above link is a PIC of his setup which looks quite cool. He has a different setup now however: more streamlined.

So check it out and let me know what you think!

Tim Conrardy

Source record: 45181

Greetings All,

I have a 2Gig JAZ divided into 4 logical drives G-H-I-J of equal size,
I'm having a read/write problem with the H drive.

Is there any Utility's that will let me find out the problem with that
logical drive and let me correct it without wiping out the entire
disk?? As I've been using this drive for over 1 1/2 years and have a
lot of stuff on it...

Thanks, Donner......

There are 4 slots. You can only use 4 cards. They must be 1MB cards or 4MB
memory cards.

DISKUS (http://www.seimet.de/atari_english.html) usually helps with
problems like this. Note, however, that DISKUS is German only and a
commercial product.

In case you are using HDDRIVER as your hard disk driver you should check
whether the SCSI drive reported any SCSI error message. The manual gives
details on how to check this.

ah, but you see The iDiot Forever Known As Sinclap can never shut up.
It's simply incapable of it, since its sad obsession with attacking all
Atari users because of some silly slight in the past won't let go of his
brain.

Personally TiFKAS' proclamations have always been sources of hilarity.
Remember "Pointcast will destroy Atari presence on the 'Net?" It was
Pointcast instead that crashed and burned. Remember "Dejanews is the
future, all newsreader programs are obsolete?". Dejanews is now a shell
of its former self, and newsreader programs on all platforms are still
being developed and upgraded, and TiFKAS has been forced to use a
newsreader program itself. Remember last year in .advocacy when it
proclaimed "all ATI video cards are crap?" . It sure began using the
crowbar to extricate its foot from its mouth after Particle Salad
mentioned to it that ATI cards are found in most Macs including the iMac
(and it claims that someone hired it to be an "Apple Power Rep!").

Oh, and of course - "If Steve Jobs ever came back to Apple, he would
destroy the company. He is an arrogant bonehead." A message that still
haunts TiFKAS to this day, even to the point of its denying that it ever
said it while simultaneously licking Steve's boots....

It will be very interesting, but what will it achieve? All they are doing is name changing to get more games sales. They are not trying to re-open Atari of old, so all it will be is a new label, nothing more.

I rue Atari's chances to have kept in the Industry. I wish there was some way for them to return in force. Just maybe, this would be start of that. I live in hope!

3 months, geesh impressive. The truth is mac os got a complete
over haul and finally after several years catches up to MiNT.
If it was so great why replace it entirely... you are pathetic
and blind. If you knew anyting you'd know that there is a
PDF viewer for the Atari... not a great one but it works.

Hi,

I have created a new community for Atari on MSN, it is called Atari users, I have looked around for such a community, but failed to find one, they are a little too specialised.
What I want to achieve is a community where any aspects of 16/32 bit atari computing can be talked about, from beginners all the way up to experts, with talk of news, sharing of files, sharing of links and photographs of members setups. Basically a good starting place for Atarians.

Feel free to join, I know its msn and that is a bit annoying but they offer good tools.

My goal would be a library of essential files for atari users, discussion of all atari news, and other atari users to contact and compare systems/problems.

please feel free to join, it is under construction ATM.

many thanks

Mac

>Is a release via DDP

I'm nowt to do with DDP, other than the translation of JinIcons, but i think they used their own version in the end anyway, i'm just their unofficial chief nit picker and whinger!!

>going to available in the near future then Steve?

Never in a million years, its a commercial piece, DDP will only translate resource and misc support files, with permision of course, distribution of a binary is summat entirely different.

>I know I for one would love to try your "patch". or pointers to what
>to actually change without it exploding! ;-)

Offset 0039 of MAGIC.RAM, change $07 to $03. This makes some multi lingual stuff take on an english accent.

One word: why?

Most Atarians I know don't bother with MSN as it is heavily PC orientated.

Yahoo Groups runs community mailing lists, and there has been loads of mailing lists dedicated to Atari (including one also called Atari_Users run by Gordy Campbell).

Find Yahoo Groups at: http://groups.yahoo.com

Or subscribe directly to Gordy's Atari_Users via email by sending a blank email to: Atari_Users-subscribe@yahoogroups.com (note the difference between the ^ & ^ (the underline, and the hyphen).

Apart from this Atari_Users list, there are others including one dedicated to MagiC, and my own Cheshunt Computer Club list (for members and prospective members). See my website for a section on my Links Page dedicated to Atari mailing lists.

Cheers!

James

>an STE could mean either tos 1.4, 1.6 or 1.62. 1.4 is rare in STEs, tho.

Actually STE's never had TOS v1.4, that was only found on ST's. TOS v1.6 & v1.62 only contained the operating system necessary for the STE's extra hardware, therefore TOS V1.4 wouldn't work on an STE.

TOS v2.06 being a later version contains the code for STE's and is able to detect whether it was being run on an ST or an STE, so it could run on either machine. Also therefore it won't run on a later machine like a TT or Falcon.

Cheers!

Hi,
I guess you forgot to use the pan controls in the mixer. Turn them hard
left/right on the stereo couple you're trying to use and it'll work much
better.
As the default, they're set to the center position...

Best regards,
Claes

I read my HDDRIVER manual, couldn't find any reference on how to check
the SCSI error message, my version is one of the earlier ones 4.x and
is a excellent HDDRIVER. I D/L DISKUS38 but have no clue as to how it
works. Hmmmmmm

Thanks for the imput, Donner...

P.S. Does the latest version of HDDRIVER come in English and a English
Manual ????

I think I got-it :) In other words if there are 8 chips on a SIMM card I
would install 8 500K chips = 4MG, and I would need 32 500K chips to
bring the TT30 up to 16MG of fast Ram ??

Thanks, Donner......

From what I understand the very very very early STEs had 1.4 as did the
first development machines. I have seen a STE with 1.4 in it tho. One that
MACE here in melbourne had me fix. Unless there are other versions of
Rainbow TOS. I have been known to wrong, very rarely tho, James;-)

Probably a good idea to find someone who has, the monitor port isn't tricky
but..... Finding the port itself will be the hard part. See if you can get
a fresh copy of that sys info software and see how that goes too.

Hello,

in article <992091988-360941AEicMi@lineone.net> (comp.sys.atari.st)
Steve Sweet wrote on Sat 09-06-2001 00:26 (-0100):

> Also hacked the language variable so all my app's (except HDDRIVER)
> think its english.

You need to patch the table of the appl_getinfo() function.

The function used to know the AES language is appl_getinfo(). It can
give a lot of informations depending on the parameter given to the
function (0 to 14 according to the Compendium). I found by chance a
patch for Mag!C 2 (for something different) describing a method to find
this function in magic.ram. Just after the code of the function is a
table with 4 words (8 bytes) for each sub-function. With parameter 3,
you get the AES language in the first word: 0 for English, 1 for German,
2 for French... and the 3 following unused words are set to 0. The code
of the function ends with 30C0 51C9 FFF0 4E75 (hex of course). This
strings occurs only once in magic.ram (tested with v 5.13 and v 6.10).
The 13th word after the function is then the one we are looking for :-).

I used Zorg to patch my copy of magic.ram (v 6.10 german, 244476 bytes).
The byte to be patched is placed at 20873 (hex) or 133235 (dec) when the
first byte is number 0 (Zorg).

Disclaimer: I cannot be responsible of any dammage on your system.
Always apply the patch on a copy of your own magic.ram.

Bye,
/Pascal/

445. save desktop in middle res.

Newsgroup: comp.sys.atari.st
Date: 2001-06-11 13:20:06 UTC
From: Tomasz Mazur <tmazur@aem.com.pl>
Message-ID: <3B24C587.E74E6660@aem.com.pl>
Source record: 45015

Hi.
My problem is:
When I save desktop in middle resolution,
all informations (widnows position, background
colour) are saved ok, but my STE always
run in low resolution. I'm new STE
user, I had no problems like this with my
STFM. Is this any bug in STE TOS, or what?
What should I do?
I hope there are some little patches for it,
to put in "auto" folder...
Presently, I use text editor to modify
desktop.inf (12 (should be mid res) to 13 (this
should be high res, but works as mid res on colour
monitor).

greets,

Source record: 45018

Hi all,

Well, my 1040 STe has a loose monitor port. It works some of the time and I anticipate it wouldn't be a problem to use a TV with it. If you use a mono monitor with it, it may occaisionally reset unless you fix/replace the monitor port. I tried cleaning it with contact cleaner to no avail. Sooooo this is one for those with more repairing skills than I.

It comes in the original box which is kind of cool. Just the main computer module, no accesories, sorry. Free shipping in the USA. $75 or best offer. Again, everything works perfectly except the monitor port. If you're interested, please email:

KappaGuy99@aol.com

Feel free to email with offers, questions.

448. Mega ST 2 RAM upgrade question

Hi all,

Just curious, what is the simplest way to upgrade a Mega ST 2 to 4MB (or more even) of RAM? I hear there are memory expansion cards available... where can I get those, I've looked but haven't found any. Don't want to do any soldering... looking for ease here. Thanks.

Matt

Hi,

Do you still have those Vortex AtOnce 386SX boards for sale?

If so, let me have some details about which versions you have for the
Atari machines. And if they are installed or not.

Let me know your asking price for each in US Dollars if you can.

Thanks,
phantomm@bellsouth.net

Ghost printing? My worn-out slm 804 (show machine, from warehouse sale, plus somebody's profit markup) died with symptoms of fainter images later in a print run, and smearing of un-wiped used toner.

After replacing the entire drum assembly, even though I suspected the wiper blade, I was pleasantly astounded by how well that machine was supposed to work. But the wiper blade was not the problem. It still had a sharp contact edge. The problem was that the drum did not either charge or discharge as fast as it should, and the wiper blade did not remove toner that was not unstuck. It looks like you just need a new wiper blade.

They are fairly cheap, but fairly hard to get, if you are not in the printer repair business. And I have a used one in good condition.

> Don't want to do any soldering... looking for ease here. Thanks.

Well, the simplest way requires a lot of soldering- but at least it looks nice. Mega 2 already has holes in the PCB prepared for additional 2MB of 1MBit DRAM chips, to make a total of 4MB RAM. So you would have to insert chips into holes and solder each pin. I suspect that finding 1MBit DRAMs in discrete chips may be expensive these days though...

Adding ST RAM with some memory expansion card would also require an amount of soldering, because there is no neat plug-in RAM connector in a Mega, unless some hypothetical card uses the Megabus port and has its own DRAM controller... Then there wwould also be the problem of physically locating and fastening the card...

The Ultimate Ripper doesn't do all the things this cartridge does, but
it can do things it can't. Program freezing is one of them.

The ultimate ripper also does things not documented, and also has a few
bugs.

Depending what you want for it, i'd be interested in it.

Hello All

I need your help!

I have been able to contact Dan Miller who was the original programmer for DR T Basic. He gave me his consent to a Freeware release. The only problem is..he does not have the program.

So I was wondering if anyone here has an unprotected copy of Dr T Basic, so we can release it to the Atari-Midi community.

Dr T Basic allows you to write your own MPE programs for use in Dr T's KCS. That would be great to write your own midi programs!

If you have the program, please contact me immeadiatly!

Hi

Oooh the med rez bug bites back:P

You will have an STE running under TOS 1.06 (1.6 if ya like).

There is a patch available. Sorry i can't upload the file for you:(yet!

Hi Claes,
Thanks for the feedback but there's where I'm confused! Which mixer?
16 track does'nt do anything (I'm in 8 track mode for stereo). Graphic does
but I'm getting the same audio info out of left and right! When pan is
centered = mono! Note that this is an audio file (not MIDI) recorded into
Cubase from a stereo tape source. The recording track was set to "any"
during recording and the monitors show that channels 1 & 2 are tied
together (book states should be stereo). Still mono out!

That's a very old bug. I think that upgrading the TOS to version 2.6 worked.

Any way, there's a solution. Edit your NEWDESK.INF in a very simple text editor, look for the string:

18 0? (I don't remember which last cipher you'll find.)

Replace the "?" by a "1", save the file et voilï¿½ !

My souvenirs are very vague but I think I'm right. If I recall correctly, "18 00" meant low resolution, "18 01" meant middle and "18 02" meant high. Or maybe it was "01", "02", "03" ?

You can try different ciphers, you won't harm your STE. ;-)

Hope it helps.

Use any of the other mixers... ;)
The 16-track mixer can only be used in 16-track mode, so the reverb or
graphic mixer should do the job.
When the Pan is set to center, the output SHOULD be mono! When you have a
stereo couple on track 1+2, you should pan 1 to the extreme left and 2 to
the extreme right - otherwise you'll never get any stereo output...

If you need more stereo tracks, you can actually move the Part to track 3 -
and then you'll have the stereo on 3+4 and then 1+2 are free for a new
stereo recording (you can only record stereo sources on the one that's set

to ANY - which is locked to tracks 1+2). You can get 4 stereo tracks this way if you want to. This is something that I don't think is widely known, so I thought it could be interesting... Don't forget the pan pots of all the tracks though... 1,3,5,7 to the extreme left and 2,4,6,8 to the extreme right. The drawback is that when you need to edit the audio in the additional stereo tracks; you'll only see the odd tracks' image and the other one's blank even though it's actually there...

Hypothetical situation:

Suppose John Doe asked "Does anyone have a copy of 'Does it all program
#1' for sale or trade?". In your scenario, any vendor or even
non-vendor having this program would individually email John Doe. Now,
supposing there are 5 other people with the same question. Would you
want to see 5 additional people ask the very same question?

Just food for thought. <G>

How about.. Atari Users Network (AUN)??

http://www.Atari-Users.Net

Users can post messages in the Forums, Read current Atari news (and post
news!), Chat with fellow Atari users, post Reviews, Join the AUN Webring,
Search and List in the Atari Links Engine, Classified Ads, Auction.. and a
new and improved downloads area (needs links to files.. SEND THEM!!).
And it's designed to work with CAB!

Hi Don,
Although I can't help you, maybe you can help me (if you come up with a solution to your problem). My problem was similer. Although the 1 gig Jazz I have was under warantee at the time, Iomega refused to check out if the drive was faulty unless I hooked it up to a PC first. No PC so....
If you can, E-mail me at swampfax@atlantic.net if you come up with something.

Pointcast was a nice idea in it's time..But MacTicker fits the bill
nicely and a site that has the most comprehensive news web site links
is the drudgereport.com.

ATI cards at the time were crap. But the Radeon card is nice and the
Rage mobility cards found in laptops such as the iBook fit the bill
nicely. ATI has come along way. But work is needed now that NVIDIA is
at there heels.

> Oh, and of course - "If Steve Jobs ever came back to Apple, he would

477. Falcon Video problem

Newsgroup: comp.sys.atari.st
Date: 2001-06-12 05:34:21 UTC
From: Don <dons@qnet.com>
Message-ID: <3B25A9DD.2496FA9E@qnet.com>
Source record: 44948

I have a Atari Falcon with 85 meg hard drive, 4megs of ram and the rest is stock. The problem is there is no video coming out of the Falcon. Ive tried a VGA ,SC1224 and SM124. None of them worked. The VGA didnt even get a signal from the Falcon. Is this a common problem and does anyone know how to fix this problem.

Thanks,

Don

478. Re: Falcon Video problem

Newsgroup: comp.sys.atari.st

Message-ID: <3B25B67A.AE60B368@aem.com.pl>
Source record: 44950

My previous letter was:

Hi.
My problem is:
When I save desktop in middle resolution,
all informations (widnows position, background
colour) are saved ok, but my STE always
run in low resolution. I'm new STE
user, I had no problems like this with my
STFM. Is this any bug in STE TOS, or what?
What should I do?
I hope there are some little patches for it,
to put in "auto" folder...
Presently, I use text editor to modify
desktop.inf (12 (should be mid res) to 13 (this
should be high res, but works as mid res on colour
monitor).

I have problem with watching news,
so if there will be any answers, please
send to:

mailto:tmazur@aem.com.pl
mailto:tmazur@kielce.mtl.pl

thx

Hi Frank!

I'm german native speaking, so the manual will be no problem ;-)
My question:
Is this card only stuck onto the 'TT-RAM'-socket or do I have to make
some soldering? Do I need an installation program for the 'AUTO'-folder?
If it's really only 'plug-n-play' I'm very interested in this card...

Best Greetings from Vienna,

Werner

You are the one in denial... hense why you surf Atari usenet spewing
miss information. I know full well Atari is not going to regain the
market, however what we do have is still very usable in todays
environment. You are the one that does not grasp these simple ideas.
Also, PDF is a horrible format anyway.

Hi,

I was messing around with FalconScreen the other day and now want to reset to the default 4bit resolution, but I can't seem to work out how to do this. My falcon now boots in the resolution that I saved with FalconScreen. Any idea how to reset this?

Cheer,

Alex.

Hi,
You can create a bootdisk which will reset the NVRAM if it's in the drive
when you start up the Falcon with this program:
http://home.swipnet.se/holmerup/programs/f030free.zip
Then you'll get back all original settings - useful if your NVRAM gets it's
own ideas... ;)

I just got WinSTon installed on my machine and have all the TOS images and a hardrive image.
I've forgotten everything. How do I make a boot directory where I load all my accessories and etc?

Is NeoDesk still around and if so, how do I get a copy cheap? I loved that desktop.

Thanks!!!

Lannie

PS had my 1040STf in the basement of a friends house for years. He did a complete remodel and the Atari was covered in 1-2 inches of dust, insulation, dirt, you name it. I had to take it apart and blow out everything. Had to take the floppy apart and clean it. We won't talk about how gross the monitor was. 1224 Color.

turned it on, bam, desktop!! Got to love those old machines!!!!!!!!!

Hello,

you can try these places for ST demo/game music:

http://sndplayer.atari.org/ - here you find synthetic music made for the
ym2149 synthesizer chip in the ST/TT/Falcon. Player for ST/TT/Falcon/Hades
avalable. Also player for windoze, even though it's a bit limited.

http://stsound.atari.org/ - syntentic music again, but more concentrating
against emulating the ym2149.

http://atarimods.dhs.nu/ - here you find digital music (mods, mpegs..).

For c64:
http://www.hvsc.c64.org/ - over 15000 files.

For Amiga:
http://exotica.fix.no/ masses and masses of music. Also very interesting
for ST users, as they have over a thousand scans of Amiga/ST-Games covers.

I hope this helps..

Your cable-modem is not the next computer in the network, it's a
single-ended hub. Your ISP's gateway is over 50 meters from your
home. The pong is most likely over 15 miliseconds.

>completely *silent* and I like that :)

[I suppose this post never got outside the telia.com domain...]

I think Edith plus or professional (can't remember the name right now)
will get the job done.

Another possibility would be to use any text editor like QED, Everst etc
on the Atari side and read/save the files as MSDOS .TXT in Windows.

All these programs can be downloaded from the Net.

If you want proper cross platform word processing maybe Papyrus is the
best, but you will need a harddisk on the for the ST.

.RTF is mostly overkill if you write simple text. I usually write
everything in QED on Atari or Pocket Word on WinCE without _any_ special
texteffects. If you need special layouts just add those at the very end
when your text is ready. Saves lots of time and you get the text proof-
read as well :-)

Thanks for the confirmation, Lyndon.
I don't think the issue is too critical, though. If the programs don't work in TTRAM they will crash. Changing the program header back to running in STRAM with the utilities mentioned previously will resolve the problem immediately IIRC.

Hi Raymond,
First, this information applies for use with the Atari TT-RAM boards,
doesn't it? I'm reasonably sure 9 chip SIMMs have been reported as ok,
but I won't contradict what you're saying if there's the possibility
of a problem.

Regarding Nibble mode chips, this is not essential but if this RAM can
be obtained then the board will work faster with them. Nibble mode are
4-bit, while page-mode are 1-bit according to my notes.

>
> jumpers w103 & w104 are for the start address remain the same 2-3
> jumper w105 is for burst mode ON 2-3 OFF 1-2

That matches my notes too. Also (from my notes):

If you have one of the 'older' atari boards which had only 3 jumpers:
set jumper dW3 to 1-2 (non burst, 2-3 is default)

Would'nt the ISP show up in posts and E-mail headers?
(E-mail addresses, paths, etc.).
Could be a good source! Although it does'nt show how good the ISPs are,
at least you know you can connect through them!.

Not so. The post asked for "National" ISPs. UIA.NET is most definitely not national.

Yes. You will need an adapter and will have to make certain your
jumpers are set correctly, but there is no reason it shouldn't work.

>
Well, no. The eye can make out the coarseness of less than 300 lines per inch. In black and white (such as text), there is very little difference between 300 and 600 dpi. Switch to a dithered 4x4 pixel gray, and 600 dpi = 150 lines per inch (lpi). Since the image is still monochrome, 150 lpi looks pretty good, but you can tell the difference between it and 1200 dpi = 300 lpi. For photos and complicated color graphics, 600 dpi is quite noticably inferior to 1200 dpi.

Thus to summarize, NVDI is fine for text and pretty good for grayscale, but you will not do better than "OK" for the printing of photos.

This said, Tigerdirect.com is selling the HP 610CL for $50. I have one, and it works quite nicely at 300 dpi color (using the HP660C driver) and at 600 dpi monochrome (using the HP5L laser printer driver). A great deal for a printer known to run under NVDI 4 (I haven't tried 5 yet). [No, I don't work for Tigerdirect -- I just buy from them]

Yes it's possible through any COM-port. You will be able to use ftp to
transfer files etc but none of the Windows (if this is what you are
using?) specific protocols will off course not work. With extra software
on the pc the Falcon can get full Internet access as well on your LAN.

You will most likely not be able to use DHCP. Simply assign static routes
and ip-addresses instead.

The manual consists of a single sheet of paper... ;-)

>Is this card only stuck onto the 'TT-RAM'-socket or do I have to make
>some soldering? Do I need an installation program for the 'AUTO'-folder?
>If it's really only 'plug-n-play' I'm very interested in this card...
The card is really "plug and play", it doesn't need any drivers either. All
you might need to do is set the flags of some programs you use to run from
TT-RAM.

If you decide that the 128MB is not enough and want to upgrade to 256MB,
then make sure you buy SIMM's that are recommended for the Magnum, using
incompatible SIMM's may cause read and write errors...

Cheers from Belgium
Dennis

>Also, PDF is a horrible format anyway.

Indeed- and its name seems highly misleading to me. The portability of this "Portable Document Format" is so "great" that on any computer platform there are just a couple of applications which can decipher it- or none at all. And if one gets a perverse desire to edit a PDF document, or extract a segment from it into some other format, even more problems await him.

About the only portable document format worthy of this attribute appears to me to be the "Rich Text Format" - or it would be so if it were not for the gigantic size of .RTF files.

This is a must if you have no Ethernet connection on the Atari.

>There's a slight change that I get ADSL this summer, but I don't think I
>would bother with PPPoE or DHCP on my Ataris. Instead I'll set up one of
>my PCs to act as a firewall/router/web-server.

Using a pc webserver is to ask for trouble. Lots of security holes.
Instead join the club of Weblight servers online. 100% stable, and there
have been some who were trying to overload or hack into the server.

I am using a Netgear RT314 "Gateway Router" that acts as DHCP client on
the WAN side. It also provides NAT (ip masquerades) on the LAN side. I
have one of my Ataris connected to the router via the cartridge port
Ethernet adapter. The rest of my Atari LAN is connected with nullmodem
cables so all of them have full Internet access.

The Swedish isp Telia uses an unusual way to "log on" via a webpage that
uses javascipt. This is of no concern to as I 1. never "log out" 2. have
a Win-pc coonnected to the router.

If the isp uses ppoe the router can identify itself and the DHCP stuff is
also taken care off. In this case I see no reason why a single
Atari+Router could not be used.

It would also be possible to be without pc/Mac on my Telia ADSL if I had
taken the time to write an autologon program. It would require some
knowledge that I don't have at the moment so don't count on that. I have
managed to write a GFA Ping program for STinG so maye some time...

Maybe the Adamas browser would survive this simple javascript? Combined
with the announced DHCP client/server suite for Mint it could perhaps be
possible to do without the router as well. On the other hand a "Gateway
Router" also serves as firewall aginst the rest of the Net. There is
really a lot of portscannings etc, going on.

Linux is a stable enough platform, and of course there are others QNX
for example.

So i'll be sticking to something a little more common.

Hi,

Okay tried this and appears to have reset the NVRAM (boots in low res), but
when the desktop comes up the resolution is still wrong.

Any ideas?

Cheers.

Hi,

I recently had to do a re-install of everything on my Falcon. I'm now experiencing some problems with HDDriver. When I boot off floppy I can see all my SCSI devices fine, if I try to boot off disk I can only see the internal IDE drive even when I boot off an external SCSI device!!! I've also recently reset the NVRAM, is there a setting in here thats causing this behaviour?

Cheer,

Alex.

>I have never been able to get Weblight to work.

Thats _very_ strange! I had never touched a webserver before I setup
Weblight. It's extremely simple as long as you do not involve cgi, Perl
etc. But the examples that comes with the program with counters and forms
do work with Magic. When I tried them with Geneva I got lock-ups because
of a bug within Geneva.

I now host my home-page at home but still without any fancy stuff that
could perhaps make the setup less reliable. Tomorrow I will revert to run
it via 57600bps nullmodem as I will bring the Ethernet adapter with me to
NAS in Malmï¿½.

I have had it online for 6 months now with about 20 hits/day webcrawlers
not counted for. Stats4All claims 2099 hits since 6/3-2001. By now I
think most search-engines have been here at least once. I have seen a
Russian guy who tried to take it down by downloading lots of files
simultaniously until Weblight got out of memory. At this point it will
revert to send a page stating it is temporarily off-line. When this
happend the guy stopped requsting files and after all open connections
timed out everything got normal again without any action from me.

Also someone from China tried to get root access thinking it was a
Windows IIS server. Fun to look at. Anyway it has sofar not bombed a
single time. All I have to do is reboot once every 5 days or so because
STinG develops some memory fragmentation over time.

>STe.

AFAIR, TOS 2.06 (and the earlier 2.05) has a look up table in it so that TOS 2.0x could be used on any of the machines then existing. Therefore it was the only multi machine TOS that came out. TOS v3 and v4 were only for TTs and Falcons respectively and can't be mixed between machines.

To reply to Mark, TOS 1.4 COULDN'T work on an STE because the hardware support for the STE's extra hardware just wasn't there. However TOS 1.6 was very similar to 1.4 in all other respects (although it did bring in the medium res bug that then got fixed in TOS 1.62).

Sad, and you will miss my latest experiments in STinG networking. I now have my WinCE Cassiopeia handheld connected to the Atari serial port just using the original sync cable. Makes it possible to transfer files and mail, Surf the web and use Avantgo through the Atari network.

On the other hand there will be plenty of space for other visitors :-)

Set the resolution you want in the preferences, then choose "Save desktop"
in one of the menus on the Desktop (don't remember which one - but I believe
it's the one furthest to the right...)?

> >anyone know how to fix this problem.

Sometimes, the NVRAM causes this. You may have a bad battery in the
NVRAM-"chip", so it needs to be replaced (the chip that is - the battery
can't be replaced). If you have access to another Falcon that's in working
condition, you can create a boot-disk with this program:
http://home.swipnet.se/holmerup/programs/f030free.zip and start your Falcon
with the created disk inserted. If the machine works then, you've found the
problem... IF the battery backup in the NVRAM is bad, you'll notice the next
time you try to start the machine after leaving it off for some time... ;)
Sometimes the NVRAM gets it's own ideas and only needs to be reset to come
to grips with reality again, so if you're lucky it may be the solution.
For some other hints, take a look at my site - the Troubleshooting page.

I remember a couple of months ago there were some messages concerning the MagicSLM accessory and I had mentioned problems I was having with the Windows printer drivers. Someone had mentioned that the source could be made available. Well, as of late, I was feeling up to the challenge of messing aruond with it. Is there any chance that someone with the source could make it available? I 'd like to see if I could messa round with it to try and get it runnning with Windows drivers. Let me know! Thanks!

I can't remember the web address but if you go to a search engine and try searching for Link96 or link97, those are both recent, and quite good scsi hoste adaptors. I have an ADSCSI+ that I got in 1994 with my STe, it works well but I think its harder to find now.

My understanding indicates that the Atari RAM boards could only use the 8
chip set 30 pin SIMMs due to non-parity, 9 chip SIMMs have parity.

>
> Regarding Nibble mode chips, this is not essential but if this RAM can

To quibble a little about nybble (nibble) it is needed for a functional
burst mode
on a TT030. Thus if using non-niybble SIMMs you must set jumper w105 to
OFF.
Combine burst mode with a Cattamaran and you can get very fast machine.

>
> Thanks, Donner......

Nope!

There are only 4 slots. The 30 pin SIMM are bought with the chips on them
you
do not create them as on the older STs buy swaping on the chip.
```

For the Atari TT RAM board you can only use the 1MB SIMMS with 8 chips,
NOT 9, 3, and or use the 4MB SIMMS with 8 chips.

FamilyNet Newsgate

Some really cool stuff here!

I was flipping through some of these. The carrying case looks really
cool, but I saw one thing I couldn't live without...

> STormTracker - MOD creater
> Minimum bid: $9.99
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1245849787

That sucker I bought! Hehehe.... I've been playing with Protracker, but
this looks like it has a awesome interface for making MODS. Alright... guess
I'll have to prolong packing away my ST for another month so I can play with
this. (grin)
I love creating MOD files for Newton users to listen to, and I have found
that the most compatible MOD files were created on... a ST. (grin)

Hmmm... wonder if I could get a ImageWriter II to work with a ST using
Spectre. (Since I'm having no luck getting the SLM 605 and the Spectre to talk
to each other....)

This platform has piqued my interest yet again. :)

Doctor Clu

Now if I can only get my $*&%#*@ 800XLDJ and SIO2ST cable working again.
And that friggin $&*^%$ internet connection....

gripe gripe.... Hehehehe....

552. [Epyx Shrine] Summer Games

Newsgroup: comp.sys.atari.st
Date: 2001-06-14 08:57:04 UTC
From: Manuel Polik <cybergoth@nexgo.de>
Message-ID: <3B287C60.824C46DB@nexgo.de>
Source record: 44870

Hi there!

The Epyx Shrine (http://home.nexgo.de/cybergoth) now features an additional page about Summer Games with three interviews and there's more interviews about the game in the pipe...

The Atari ST version of Summer Games might be new to some too :-)

I'm searching some friendly guy with both a scanner and and Epyx catalogues from Fall 1985 or from 1986. Can someone provide complete+readable scans of such treasured items?

Greetings,
Manuel

But do you think the slowness is a printer or computer problem?
Can you give an idea of how much time spend your printer to print for example a papyrus doc or something similar. Just to have a reference. I find my printer very very slow almost unusable, there is a big diference of speed when it works with a Pentium III PC.

A>boot off disk I can only see the internal IDE drive even when I boot
A>off an external SCSI device!!!
do not 'hide' any SCSI device to your HDDRIVER. Start HDDRUTIL and
switch on all your devices (at least your hard disks) and be sure the
copy of HDDRIVER.SYS on the floppy disk is identical to that one on
the boot drive!

Und TTschï¿½

Perhaps I haven't read the docs close enough, but when I installed it on my TT (MagiC and STiNG), I couldn't get any response from any of the machines on my LAN. Absolutely no response whatsoever. IIRC I spent a couple of hours on this.

I've used both FPM and EDO SIMMS on my aixTT, and have never had any
problems except this: The aixTT use the size detection pins on the SIMM to
determine the size of each SIMM. Many SIMMs doesn't implement this
correctly. I had to solder jumpers on all my SIMMs to get them working.

Nobody seems to have mentioned 'STeeM' yet. Great emulator -- it emulates
the ST at the chip-register level better than any emu I've tried so far.
RS-232 support is lacking at this point, but being worked on:

567. Printing from CAB with NVDI and MiNT

Newsgroup: comp.sys.atari.st
Date: 2001-06-14 23:21:43 UTC
From: Milton Horst <milton.a.horst@boeing.com>
Message-ID: <3B294707.42B774E4@boeing.com>
Source record: 44890

When printing a web page from CAB, I get a line of garbage characters
about 1/4 to 1/2 way through the second page of output if it goes over
one page. About a 1 cm strip of the bit image is missing at this
point, and then the rest of the web page prints normally.
This happens when I'm running under MiNT on my Milan040, but never
happened when running under Magic 6 on my 1040ST (ET4000 equipped).
CAB version is 2.7, and NVDI version is 5 in both cases.
Printer is an HP DeskJet 560C.

Anybody have an idea on how to fix this?

Milton Horst
Seattle, WA USA

NEW PULSAR Beta Version Available

Neil Wakeling (see article in this months issue of My Atari at http://www.myatari.net : Imagination Music)has released his beta version of PULSAR, the Analog Sequencer Simulator. It is now available on my site. Main new feature is the addition of a Control Row to add continous controller messages such as Panning, modulation, ect. Please read about it (and it's limitations) on the PULSAR page (below)This is a great app worth exploring.

FamilyNet Newsgate

In recent times I said how I was ready to take my ST and
cram it into a closet. Well, while this idea is still tempting from time to
time, I realize that there are still some things I have left undone.

I realized this recently when I saw in a auction
advertised around here the program "StormTracker". I saw the picture of that,
and while I have played with ProTracker, this one had a interface to simply
add notes like on a music sheet. I knew there were midi programs for the ST,
but when I saw this in tracker form I lowered the sledge hammer that I was
about to smash my ST with and started to look at some of the connections and
bring it back up to speed again.

So those that wrote suggesting that I hang in there
and maybe even try a Hades or Milan someday, who knows. I think I would like to
stick with a boosted TT eventually (since the TT can still run the Spectre),
but all and all, who knows? It actually seems promising.

To all of those that asked me about the STE, thanks
gents, I guess I'll kept the STE for backup afteral. Besides, if I find myself
someday exploring midi and music development I might need that DMA chip.

Of course if someone wants to trade a working TT for
my working STE and a bit of cash thrown in, let me know. And to that guy that
was hedging on trading that Falcon for a Jaguar... got that Jag and CD unit
right here buddy. ;)

Anyway, the ST had piqued my interest for a little longer.
Still don't know what to think about ST's and internet, but I've been told
there is some interesting browsers coming out later this year? Believe it when
I see it.

Take care folks and talk soon,

Doctor Clu

Yes, there is. Please check the device configuration of HDDRIVER.SYS, as explained in the manual. Most likely you forgot to activate some of your devices.

Actually LINK96 and LINK97 are the best because these are the only
adapters that support initiator identification, which is required by
some devices. Some Quantum Fireball drives, for example, only work with
these adapters.

Milton Horst <milton.a.horst@boeing.com> wrote:

> Anybody have an idea on how to fix this?

I'm afraid that NVDI can only print properly under MagiC :-(This is the
main reason why I sold my printer last year.

Printing will work most of the time, but under TOS and MiNT it will hog
the CPU completely, and quite often it will output garbage (looks like
some writes are missed) or simply crash. Very frustrating...

I also use MiNT but with NVDI 5.03. I don't have any probs to print out
docs from Cab 2.8, even without w_dialog. I only use w_dialog when I
want to change the printer settings.
Maybe you should try it out with w_dialog (this isn't needed with MagiC
6 as w_dialog is implemented in MagiC).

Hi Steve,

>It appears not, i stand alone,
Not really, make that two...
For some reason I never got to see your posting, so couldn't react to it. I suppose I'm not the only one that hasn't received your posting.

>2 lines or so would also please me, but i'd still prefer not to see it
>at all, but since the masses have spoken, or not in this case.
I prefer not to see any advertisements in here either, be it informative or spam. If all Atari dealers start advertising here, or even only react to postings from individual posters searching for a certain item...

We shouldn't always blame the dealers of course, people sometimes can be very lazy. Instead of searching on the www for a dealer that sells the particular item, they prefer the easy way and ask here...
A bit like people who prefer asking questions here instead of reading the Atari FAQ first...

Cheers from Belgium
Dennis

I'll have to check which fractional version of NVDI I have.
I tried to download an upgrade for it once, but it was corrupted.
I *am* using w_dialog, maybe I should try without it.
BTW, the printer settings cpx wouldn't work with the w_dialog
replacement that came with N_AES 2.0.
It would be nice to find a way to use the printmon program, too.

>await him.

In some cases that is the point of using PDF - i.e. that you can read it but not alter it. I serve on some standards committees, and all its files are in PDF format for that reason. I can read them (slowly) with GEMGS but of course not edit them. Problem with GEMGS is that it insists on loading all the fonts anew for each page of a mutli-page document. Why it can't hold them in memory and only load in any that were not there previously I don't know.

>About the only portable document format worthy of this attribute appears
>to me to be the "Rich Text Format" - or it would be so if it were not
>for the gigantic size of .RTF files.

I agree, but suspect a lot of this is due to unnecessary repeated tags. As an aside, I received a PDF file that was some 65 kB. I had problems reading more than the first 6 pages in the version of GEMGS I was using then, so I asked the originator to send me a copy in RTF. He did, but said as it was rather large he'd zip it. The ZIP came to a little over 500 kB, but when unzipped was just over 14 MB! Too much to fit in the Falcon's 14 MB memory :-(That is a compression ratio of 95%!!! (Luckily Derryck printed it out from the PDF on his PC for me.) But it shows that PDF is a very efficient format, even when including graphics.

Regards, /Peter/

Janez, what kind of interface does your cable modem have? AFAIK
the one's available here require Ethernet (and ADSL requires USB)
which are not currently available for the Atari I believe.

Uwe
Would having a Falcon make a difference?
I Have a Quantum Fireball SCSI drive (id 0) on my Falcon,
but I boot from a Quantum Fireball IDE drive(seen as drive 0 by HDdriver8.03)
I don't know if I can boot from the Fireball SCSI, never tried.
Is it booting that is the problem, or also accesing a Quantum Fireball SCSI?
ken

Booting is the problem because TOS does not support initiator
identification for SCSI and thus cannot find the drive when searching
for boot drives.
With the LINK96/97, which does initiator identification by hardware, TOS
will find the drive. But this will not help for Falcon or TT, because
the LINK can only be used with the ACSI port, not with the SCSI port.

I just purchased an old JVC CD writer and was wondering how to set it up for use on a Mega ST4. I have an Adscsi+ adaptor and external case for it. Do I just set up chbd in addition to ahdi that I have set up for my Megafile 44? Is CD Lab the only useable shareware for burning cd's and can it copy cd to cd? Thanks in advance!

About 40 Seconds to print sys-tips.pap in Best 360 dpi B/W.

>I find my printer very very slow almost unusable, there is a big
>diference of speed when it works with a Pentium III PC.

Well, I suppose the slowness of the computer is for something in the
slowness of the printing process. But NVDI doesn't have a reputation for
speed (at least for colour printing). If the printer is fast on a PIII,
you've got your answer, haven't you? Better driver, faster machine, you
name it...

I'm a little bit confused now. What are you using w_dialog or n_dlg?
Furthermore a cpx to alter the printer settings? I thought on could this
from inside Cab (if w_dialog is loaded)
Personaly I use w_dialog (started from desktop) but only when strictly
needed. Programs that requires w_dialog to start up goes usualy directly
to the dustbin.
I can't say anything about printmon as I don't use it at all. What's the
problem with it?

605. AtarICQ 0.151 is released

Newsgroup: comp.sys.atari.st
Date: 2001-06-16 15:02:43 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0106160702.3a80afb9@posting.google.com>
Source record: 44922

Time once again for a new release of AtarICQ, today celebrating its first anniversary ;)

Most noticeable is that AtarICQ is now available in 5 languages (soon 6, I expect to release Italian version any day now) thanks to great efforts by Pascal Ricard, AltF4 & Paranoid, Rafal Kawecki, Jï¿½rgen Nyberg.

There have also been lots and lots of improvements in the code structure and many glitches have been cured in this version. Add to that some more ways to customize the way aICQ works and looks. Shareware reminders are also added in this release. List of changes is pretty long so please check out UPDATE.TXT in the full package of aICQ.

For people that can have their dialer performing disconnection scripts there is now the possibility to let aicqload (which is also updated) automatically terminate aicq when you close ISP-connection.

Related to aICQ, my colour selector (colsel) has also been updated today. You can now use it in background mode, resize the palette and wm_bottomed is also supported.

As it turns out, I wasn't loading any ASSIGN.SYS file when booting. Now I am, and it still doesn't work. I suspect that's because GDOS isn't being loaded. Why isn't it being loaded? Because it hangs my TT. ::sigh:: It's GDOS 1.1 which came with LDW Power.

I've never successfully printed from LDW Power with NVDI installed on this particular system setup, either. :-(Nor with any of my text editors, either.

Were you using a TT when printing with the SLM?

Ken

Hi Peter,

I have Ethernet interface. There are Ethernet adapters for Atari.. Im using Riebl VME Ethernet card, available for TT and MSTE, there is also MST version of Riebl card, u can get Hilgart's ROM port adapter (using Pocket Ethernet Adapter) for all Atari models, BioNET adapters, PAM's adapters altough those are harder to build, there is ACSI to ISA adapter for ne2000 card, etc.. Just for info: Riebl cards are dated 1991 ;)

Tifkas indeed you are. I can read PDF on my computer very well, thank you-
which does not mean I have to like it. And you have in fact confirmed what
I said- you must have ONE specific application in order to read something
which is called "portable". Imagine for a moment that Adobe reader
do not exist... how many would be able to read PDF comfortably?

>PDF is here.. Email apps will incorporate with the recipient recieveing
>an open PDF in the email..Sounds like progress..

I don't remember anyone mentioning widespread applications which directly
edit PDF documents (you know, read, modify, cut, paste, write PDF)-
which would be required for such "progress".

It's years since I used a plain ST, but may I ask: can you not simply
drag floppy icon A on to icon B to recreate a whole-disk image copy?
The second floppy must of course be of identical format to the source.

Charles.

I wouldn't bother myself, if it can't be accessed by the very programs that run
on the system that this site is supposed to support TBH.

>solder jumpers on all my SIMMs to get them working.
Agree, but this solution isn't everyones cup of tea... in case one fits
SIMMs that need this alteration, the Aixit card only detects the first
bank (8MB). So unless you start soldering and know exactly what you're
doing it's better to buy the recommended types of SIMMs for the Aixit
card...

>>If you decide that the 128MB is not enough and want to upgrade to
>>256MB, then make sure you buy SIMM's that are recommended for the
>>Magnum, using incompatible SIMM's may cause read and write errors...
The SIMMs size were recognised correctly, but when transferring files
(especially big ones), the files sometimes got corrupted.
Switching back to 128MB cured this.

Cheers from Belgium
Dennis

>Well, I suppose the slowness of the computer is for something in the
>slowness of the printing process. But NVDI doesn't have a reputation
>for speed (at least for colour printing).
NVDI is page oriented, meaning that it needs a lot of time to calculate
a page, especially in colour... besides "eating up" memory this method
is time consuming as well, just place a small thumbnail in the middle
of a page and print it... :-(

Hiya

Which model of cartridge do you have?

There are 2 versions, a small one and a big one.

They both need software to use them, I do have the software for the big
one that uses options.

This one has the ability to have other drives, through port and ROMS
inside.

I have the software to drive them and some parameters files etc.

>The second floppy must of course be of identical format to the source.

Dragging a floppy icon onto the other floppy icon, copies the contents
from one disk to the other it doesn't format it AND it only copies 9
sectors per track and 80 tracks (single or double sided depending on
disk).

If you try and copy most commercial disks, which are 10 sectors per
track and 81 tracks, it may look like it's been copied but it wont be.
The contents of the sectors will have been copied along with the fat
tables etc. but the 10th sector on every track wont have been, and this
will be missing (including it's data).

You must also make sure the disk is formatted before you perform this
type of copy AND even if you format 10 sectors per track it will still
only copy 9, it will leave the 10 th sector alone.

I have seen this mistake time and time and time again.

And there is nothing that can be done with data that is actually
missing.

An hd driver had nothing to do with an cd unit.

Extendos 3.3 is a an exellent driver for cd rom and cd writers.
CD-Recorder is another software to write cds.
SPIN is ok for cd roms

Writer modell must supported by writer software.

Regards, Robert (CDRW 4260 with extendos on falcon)

Ok, I'll grant that there may be a need for such read-only format,
but I would not call that "portable".

>>About the only portable document format worthy of this attribute appears
>>to me to be the "Rich Text Format" - or it would be so if it were not
>>for the gigantic size of .RTF files.
>
>I agree, but suspect a lot of this is due to unnecessary repeated
>tags.

Obviously the whole concept was borrowed from TeX which, in my opinion,
formally defined all there is to know about text processing. Control
sequences, groups, stack pushing and popping, etc; all look very much like
TeX, but with a lot of (probably unneeded ?) complications. And TeX source
documents have quite agreeable sizes, contrary to RTF.

Now when I think of it, TeX is (or was?) quite a portable document format
(both as source and as DVI) and in its prime time widely accepted by many
scientific magazines, etc. It lacked just a couple of things for complete
usefulness: a) ability to set text at arbitrary angle, b) ability to
directly handle vector (bitmap can be handled) graphics- just simple line
drawing, and c) use of more standard font files, such as TTF (though this
can be circumvented in a way).

In fact, with a good WYSIWYG GUI which would convert user input to TeX
and v.v. in "real time", TeX could still be on equal terms with any other
document format.

Btw. for a while I have been contemplating to adapt a DVI-driver for
graphic VT terminals which I coded some years back, and to make it
translate DVI to RTF...

Cu.

>NOT wana run Netscape, or Gimp, or Word or Photoshop etc on my Atari!

I would like to run Netscape, actually. And any spreadsheet in
English with some decent abilities would be nice too. Maybe if GEM/X
were operating on a fast machine and someone felt like it, they could
port over StarOffice so I could have a damned spreadsheet that can
make a decent graph. And a faster Atari would also improve Calamus,
which I love.

I need speed in my work, and until my Atari TT gets faster, it'll play
second fiddle to my ultra-fast PC in almost every regard. And there
isn't any 68k chip that'll satisfy my needs. Not desires, needs.

Just my thoughts ;-)

>
>Is SpeedoGDOS working in the same way? I don't remember that it was so
>slow.
Yes, IIRC even good old GDOS is page oriented. The difference between Speedo
and NVDI is that the latter dithers/rasters the images which is very time
consuming and can also output in true color, which is not only very time
consuming but also *eats* memory.
A line oriented printing program will need time to calculate the image
also, but it doesn't need a lot of memory to do it in.
As for speed: printing an image in A4 format will take roughly the same
time, but when only a small part of the page needs to be printed (ie. a
letterhead) then line oriented printing is much faster.

A program needing 85Mb RAM to produce a true colour A4 page, is not really
acceptable on our platform. The programmers offered a possible solution in
the form of a spooler and the famous "background printing". They didn't
mention that the spooler needs at least a partition with 100MB free space,
and that the "background printing" can only be achieved under MagiC...

I like NVDI as a screen accelerator but as a printer driver it's not
really all that good... the output which after all is *what* matters is
"acceptable", while acceptable may be good enough for some, it's plain
lousy to others. If you want to see "photoquality" prints produced on a
Atari then stay away as far as you can from NVDI. ImageCopy does it much
better, and it's line oriented....

IMO NVDI is very well suited to print text, gray scale and b/w images, but
when it comes to colour.... :-(

Cheers from Belgium
Dennis

Ghostscript. It works good but rather slow. I use it to print out all
the pdf docs I retrieve from the Net. BTW, there is a new online Calamus
magazine (German only) It comes in pdf format and guess what?
Invers have make a link toward the Atari pdf reader. That's service.

Hi Janez!

Thanks for the reply. It seems there isn't a Riebl card that works
with the Falcon. Does Hilgart's ROM port adapter, do you know (I
believe the Falcon ROM port is different from the ST/STE/TT one)?
What about the BuiNET and PAM? And do any of them need MiNT, or will
they work with Magic/NVDI?

Regards, /Peter/

AFAIK in the UK the BT ADSL hardware only has a USB port. But in
any case my interest would be for cable modems, as my cable
supplier is just introducing the service in my neighbourhood.
Haven't seen his hardware yet and won't order until I have (and
can be sure it will work with my Falcon!).

It is called Ghostscript. It needs to be ran in 256 colors. Anything more than that will result in a blank screen. It works great on my Hades and brings up the PDF file with the graphics. The big thing is downloading all the files (especially the font files). You must have all the necessary files before the program will run. Try the sites below:

Hi All

Can anyone tell me what are the minimum systems for running MagicMac and MagicPC on?

I have seen quite a number of PowerPC based Macs available secondhand here in the UK but I am uncertain as to which CPUs are best both for Magic and any current Apple Operating Systems. Is there an official site somewhere which records which Apples can use System X (if that's the newest?). What about Notebooks?

I am thinking about a PC Notebook as well, probably for Net access with Javascript(boo-hiss!!) enabled Web Browser - again what's the minimum CPU people would recommend here (+ for MagicPC)? Looking at a refurbished one at the moment.

Any comments would be appreciated!

Thanks

Neil :-)

ROM port from Hilgart works on Falcon too.. MiNT and STiNG, altough i think with MiNT performs better... Anders has it, so he will know best, but i think its preety good. PAM's and BioNET are DMA driven adaptors (i think). I dont know how they work, if at all, with Falcon. I use TT as server and have Falcon connected to it via PLIP.. Since TT runs IP masquarading, i can acces net from Falcon normaly, as from TT...

Riebl require MiNT.. Hilgarts ROM port adapter is happy with STiNG as well.

I doubt if this would work if FastCopy III didn't. That has facilities to
write an Image Copy - I wonder if he tried that? BTW, I find that this
function in FastCopy Pro won't work with MagiC loaded - but it's OK
without it. It seems to write an extra 32 bytes at the start as compared
to what is visible in Harlekin's monitor when looking at the floppy in
hex, though this might be dropped again when the file is restored from
the image to another floppy - haven't tried that.

The old Michtron Utilities as well as KnifeST allow you to
establish the BIOS parameter block, which gives info about sectors
and tracks on the disk. These might show any unusual formats.

But I have heard of protection schemes that relied on a small hole
burned in the disk with the laser at a certain position outside
the used area. When checking, the program tries a write at that
position, and if it can it knows the disk is not an original. I
have no idea how it does that if write protection is on!

There are other schemes that don't put some info in the FAT or perhaps
wrong details in the boot sector, and others that have a small
executable program in the boot sector. But I would have thought
that an image copy would get over that.

Anyone know more about protection?

Regards, /Peter/

Thanks Janez!

Now where can I get further details of Hilgart's ROMport adapter?
And is it available commercially or is it a do it yourself job?

Anyone with any experience of it, please contact me or post here.

Regards, /Peter/

It works fine on the Falcon. It will work with both MiNT-Net and STiNG, although MiNT-Net seems to perform better than MagiC+STiNG. It seems to hog the CPU during high loads under MagiC+STiNG, I've never experienced this under MiNT-Net. Stability is very good in all cases though.

> What about the BuiNET and PAM? And do any of them need MiNT, or will
> they work with Magic/NVDI?

I have two Riebl-cards, one BioNET and one PAM's, these are all VME-cards. The BioNET-card is useless to me, the driver (MiNT-Net only AFAIK) only works on a Mega STE. If anybody's interested in this card, please contact me.

One of the Riebl-cards is definitely broken, the other one seems to work fine except that the TT crash when it receives a packet... This applies to both the MiNT-Net and STiNG-drivers. The MiNT-Net driver for the PAM's-card crash when it loads, the STiNG-driver seems OK but I haven't been able to get a stable connection with it yet.

To sum it up: I have never been able to use any of these VME-cards on my TT, and I was just about to give up the entire ethernet-project when Elmar Hilgart's ROM-port solution appeared. I have two of these cards, one in my Falcon and on in my TT, and they both work extremely well. Performance isn't that great (~200kB/s), but it's very reliable and stable. Don't think I've had a lost packet yet :-)

There is a Riebl-driver for STiNG as well. I've never been able to use it
(see my other message about this) so I can't tell how well it works.

In the early days, mainly 5.25" floppy things (mini frizbies), they ysed
to stick a pin at randon to create a protection system.

I've not come across a modern system that would do that on DD 3.5"
floppies!!

>
>There are other schemes that don't put some info in the FAT or perhaps
>wrong details in the boot sector, and others that have a small
>executable program in the boot sector. But I would have thought
>that an image copy would get over that.

There are lots of ways to format a floppy disk. You can have mixed sized
sectors, even raw data. And you don't even need a file system.

In fact early copies of Taipan can only be played on early TOS machines.
It doesn't have a standard 512 byte boot sector, which TOS 1.2 and
greater can't boot from!!!!

>
>Anyone know more about protection?

Some common form of protection, which can use the standard file system,
are as follows.

Copylock: rob northern comp. several versions all depend on the timing
on the machine. They can fool the computer into thinking it has a 12 or
13 sector formatted track. It's written via a custom track.

The jist of copylock is that the program is encrypted with a figure
derived from a checksum and timing (that's why some STE's won't run
these disks). The data is then decoded and treated as a normal program.

Another method is to have lots of sectors on track 79:) although when viewed via a sector editor you'll get lots of track sync marks etc... but viewed via sector id, they will all have a crc error!!!!

Some protections are very well hidden, and if you don't know what you are looking for, will never find it in a month of Sundays.

That sounds right to me too.
The other part I don't understand is why Sysinfo doesn't report the
right TOS version. I don't use this program, but I do remember that
some utilities had difficulty with TOS version numbers around ths
time. Even though it was known as v1.4 or v1.6 they should really have
been numbered 1.04 and 1.06. As such, TOS 1.62 often got reported
erroneously as TOS 1.98. If you're getting this, it's really 1.62

>> TOS v2.06 being a later version contains the code for STE's and is
>> able to detect whether it was being run on an ST or an STE, so it
>> could run on either machine. Also therefore it won't run on a
>> later machine like a TT or Falcon.

Pereversely, TOS 2.06 came out after TOS v3.06. It made some features
of the TT's TOS available to ST's after the event.

The ealry versions of the STE came with 1.62 which also has the Rainbow Fuji logo. So the STE with 1.4 you thought you were looking at may have been 1.62.

I don't think anyone wanted you to have to defend this position. I
agree with you whole-heartedly here. The actual thing is much better.

I have to defend this position constantly because of another computer
I use allthe time, a DEC Rainbow 100. There are probably ten users of
this machine left in the world. It runs MS-DOS and CP/M. But it's not
IBM compatible. I always have to answer to people as to why I would
use a slow, old DOS machine. Well, I love it because it's different.
That's all.

And original Atari's are sweet. I would totally buy an accelerator
for my TT if I could get one. But another faster Atari would be good
too. And UNIX apps are kinda neat to have ported. People always say,
"Your Atari runs what!?!" And there are no replacements for some
Atari apps. Calamus is the best example I have. Calmaus PC is a
little odd since it is running in an emulator. I prefer it on my TT.
I've yet to see a program that matches even Calamus SL2000 Lite in
functionality. But a new webbrowser would be nice, although Lynx is
usually fine for me.

I do understand your viewpoint, but I think some people would like a
faster computer for runnning larger GEM apps and some ported Linux
software. But I don't think anyone wants it to be a "PC clone", just
maybe use some of the hardware.

661. More Atari-Midi Freeware: MidiGen

Newsgroup: comp.sys.atari.st
Date: 2001-06-18 04:56:10 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0106172056.691e69b@posting.google.com>
Source record: 44828

Hello All:

Petra Wolf and Joker finally decided to release MidiGen, an
Algorithmic Midi Generator with some very cool graphics as well.There
is
no Manual ..YET...but he is planning on it for sometime in the near
Future. In the meantime, this description (below)is ALL THERE IS! But
by
clicking on things, you can figure things out.

Go here:

http://groups.yahoo.com/group/atari-midi/files/Jokermidi/

Look for MidiGen.zip

Sometime soon, I will be adding it to the KLANG PIRATEN page on TAMW
where there are other Petra Wolf and Joker Atari-Midi apps made
available. (Zues and Prophy)But in the meantime: check out this very
unique app. You won't find it on any other platform but ATARI! (
YEAH!! :-)

Tim Conrardy
TAMW
http://sites.netscape.net/timconrardy/index.htm

MidiGen General Description
Q & A session between Tim Conrardy and Joker
==========

Tim Said:
>It sounds like M , tunesmith and Schoenberg composer all
>rolled into one.

Joker responds:
Thanks, Iï¿½ll tell Petra!

>1. What is it? a general description.

Planed to be a "simple" MIDI event generator for (mostly Note
on/off and
Controllers), to overcome the poorness of the user-interfaces of
those
early 90th synths, it grew bigger and bigger . . .
It was designed for use in my live-setup, that I do improvised
music with

and I used it intensely for about 4 years.

>2.What is the basic outline :

21 generators, ect.
Up to six sets (to be used alternately) of 21 independent
generators each.

Lets take a look at a generator:
It can send data on 4 MIDI channels, up to six controllers are
availiable.
MIDI and controllers have basically the same generation algoï¿½s:
random within range
intervallic within range (ascending-, descending-, asc/desc-,
permutational-order)
random+intervalic within range (see above)

For generation of MIDI notes there are additional features:
12-Ton - apliying the 12-tone rule: has to go through all notes
of scale,
before a note repeats
Ton Intervall - sets the interval to half, quarter, 8th or 16th
of a note
(using pitch-bend)
Dauer - lenght of generated note (the polyphony is 5 notes per
channel)
Mono - for monophonic synths, sends a note fo before playing the
next note
controller only - switches of note generation for that generator
(mostly
to preserve computational speed)
Timer T - adds a random timing-interval from a range (i.e.: Time
is set
to 5, Timer T is set to 10, range from 20 to 80 means: at every
tenth
generated note, a number between 20 and 80 is added to the
timing)
Timer P - the same for generating prg-changes
etc, etc. . . .

>3. Can it send Midi clock?

No, the timing is based on "system ticks", a very unstable
timing-base
(you may have noticed, that it runs faster if you move the
mouse). Also,
with a growing amount of data to be computed with lots of
generators
runnig, it slows down. I never needed any timing stability or
sync-possibilities, as I use it for abstract sound-sculptures,
not as any
sequencer source (the interactive-phrase-synthesizer built into

Cubase is
a much better tool for this)
>
>BTW, looks like it was designed with TT-HI in mind: excellent
to use at this
>res.!
We never had a TT or high-res Monitor (just Overscan, which
worked fine),
thats just a benefit of trying to provide the highest possible
compatability.
all the best,

Joker

Well we already have clones based on these (Hades, Milan) and as the
680x0 CPUï¿½s are
not going to be developed any further (Motorola wants to replace these
with Coldfire)
it would IMO not make too much sense to develop (yet) another clone
based on that technology.

/Joakim

Developping clones using a new architercture for a platform
already as limitted as ours would kill it, even though Coldfire
is supposed to be 90% compatible with the 68k instruction set.

That must be a function of your Hades and/or graphics card, for it (GS) runs perfectly well in 16 colours on my Falcon (OK, so sometimes it changes the desktop palette whilst it's running).

I wouldn't say that it is capable of showing or printing every PS or PDF file out there, but then again there are some that even Adobe's reader barfs on.

last I heard, MagiCMac was designed to run on and to work with as
little as a 68030 processor Mac. Of course, faster processors will make
MagiCMac scream.

There was a report that MagiCMac falls over under OS 9.1, but that
may have been fixed recently. I know that last year ASH announced that
they were working on an OS X version.

> Is there an official site somewhere which records which Apples can use System X
> (if that's the newest?). What about Notebooks?

Apple's site certainly does. Just about any G3-based computer built
by them (except for the first G3 Powerbook) should be able to run OS X,
as long as you've also got at least 128MB of RAM and a huge hard drive
(in gigabytes) to install it on (oink, oink!)

Do note, though, that a number of clever clogs have been able to get
OS X to run on machines that Apple doesn't want you to run it on (as
they'd rather you bought a shiny new Mac). I've read of some success of
9500 and UMAX J700/S900 users to get it to run on their machines - some
without the benefit of G3 upgrades! And G3/G4 card upgrade companies
like Sonnet and Powerlogix are now offering (or will be offering)
support for OS X to run on their card upgrades

Hi,

no I mean the resolution is still the one I saved in FalconScreen and not
one of the std Atari settings. As a result I have big white borders around
the edge of the desktop.....

Cheers,

Alex.

Probably because the M68K is no longer made or supported. Any new computer
based on this wouldn't be able to get any better with the same CPU family.
And as the 68060 is starting to show its age, one would be able to get a
faster machine by using a newer CPU and good 68K emulation.

I want to get my hands on a Falcon w/ 14MB and FPU & mouse and don't have
any money to buy one. I am willing to trade the following:

DFI K6XV3 motherboard (2 usb, 4 pci, and 3 isa slots)
450Mhz AMD K6-2 /w heatsink/fan
atx case and power suppy
128 MB PC-100 ram
Voodoo 3 2000 pci video card
Soundblaster 64 ISA sound card
10gb hard drive
1.44 floppy
40x IBM CD-Rom Drive

USA only -

jonk

<clip>

Lucky Falcon n TT owners :-(

just have 1040ST (4meg) - 330 meg HD
Spectre GCR (lot of HD formatted for Mac)
Golden Image Scanner
Discovery Cartridge
VIDI ST
Video Key
Monitor Master
PC-Ditto
IB copy

130XE (1 meg)
800XL
810 interface
US enhanced 1050 disk drive
Rana drive
TRAK drive

not much - but been cruising the
web through my ISP (Lynx) for about
3 years on both of them <smile>

Speaking of which, I looked at the Wizztronic page and that clone
that never came to be is still there and spec'd with an 030.
Seems like it would be cheaper to buy a used TT or Falcon. ;-)

682. Re: Printing from CAB with NVDI and MiNT

Newsgroup: comp.sys.atari.st
Date: 2001-06-18 17:05:06 UTC
From: Milton Horst <milton.a.horst@boeing.com>
Message-ID: <3B2E34C2.A15DD1A0@boeing.com>
Source record: 44843

I managed to upgrade my NVDI to version 5.03.
Regardless of whether I use w_dialog, n_dlg or neither one,
I get the line of garbage and missing 1cm of print.
The NVDI printer cpx runs with w_dialog, but does not run with n_dlg.
When I boot without either one, I get a message telling me to start
w_dialog manually (which I ignore).

I tried printing (from CAB) to .IMG files and to a GEM Metafile.
Both of these do not show the error when displayed, and can be
printed with GEMVIEW although not full page size (only the first
page of the GEM file prints). I also tried printing the .IMG files
with SMURF, but got sections of the image repeated on the page
(very strange).

I'm guessing there is something about the mint environment that the
HP DeskJet driver doesn't like. Is anybody out there using an HP
printer without problems? I could also try printing the GEM Metafile
with the GEM Output program if I can find a copy of the Atari version.

Yes, still m68k did serve us good for lotsa years, 060 aint so
bad.. Coldfire until now didnt have pmmu and fpu thus useless, the need
for emulation via libraries also aint looking good.. Even Intel is in that
list...

My first TTRam board was from GE-Soft, so I'm only repeating the comments of others. I'm interested, though, in the fact that there was more than one Atari board (as indicated at the bottom of my message). Maybe the different boards had different restrictions? I'm guessing, obviously, but your advice would seem to be the safest here.

>> Regarding Nibble mode chips, this is not essential but if this RAM
>> can be obtained then the board will work faster with them. Nibble

> you must set jumper w105 to OFF.

Sure, but my point was that you said they _must_ be nibble mode. I found these to be difficult to obtain (nobody knew what I was talking about when I enquired) but normal RAM will work fine with the jumper for nibble-mode switched off. That's all I was saying - just in case anyone got worried about not finding the faster version.

I think this was the point of your mesage when you described the newer
TT Ram boards. That must've meant the newer _Atari_ boards, I think.

>
> Anybody have an idea on how to fix this?

I've had some problems in the past likethis with my Laserjet 3P. I'm not entirely sure how I've rectified it, but if I've had a program crash in the same session I get this kind of problem. Also, when I've changed my setup (ie when I've upgraded NVDI) and tried to print, I couldn't print successfully until I'd reconfirmed the printer driver to be used in both the NVDI control panel and the print option of the application I was using (Papyrus in my case IIRC). Maybe you could try messing around with this?

My final suggestion would be to wonder whether the print file was being sent to the Deskjet too quickly. The DJ560C is very old, so maybe it's getting overloaded? Maybe try SLOW_PRN.DEV in the NVDITOOL.S folder?

Good luck...

I'm not sure the AdSCSI will support writing to CDR(W) drives. I think
I was told the host adaptor needs to support abitration, so needs to
be a Link96/97 if using the DMA port. The SCSI port of the TT/Falcon
is ok though.

Can someone confirm this, please?

Thanks a lot for such a bunch of information.
But when I opened my (second hand) TT (which has a MatrixTC1208-GfxCard
built in) there where so many extra modifications (except the
Matrix-Card) which I could not classify, so I have to refrain from
bidding in Frank's auction.

:-(

But my 8MB FastRAM did it in the past... :-)

Best Wishes, Werner

Steve,

I think it's the large one (larger than a Spectre GCR; about 4.5x4.0
inches) with two floppy ports on the back. A floppy cable is connected to
the port marked "Computer" while the other port is marked "Drive A/B"
There is an empty port on the back marked "Drive 3/4"

On the front is a rectangular cutout and two small oval cutouts but
nothing to connect to.
Finally, the label on the bottom reads "Option: [O]"

Hi Harry

Although the anodyne website says it isn't possible I have seen a pair of Yamaha cd-writers write CD's quite easily interfacted to an adscsi. The president of the local user group demo'd this setup in february, saw it in person. My doubts dissapeared after that.

I happen to have the REVOLVER software if anyone wants to try it. I
think its still un-opened. I can't vouch for how its works but I
remember it being hailed as a really great way to run multiple
programs. From what I remember it doesn't even come close to being a
true MULTI-TASKING shell.

You were told something wrong. Writing CDs has nothing to do with bus arbitration. Some devices (in particular some Quantum Fireball models) require initiator identification, that's all. There might also be CD writers that require initiator identification, as streamers or CD-ROM drives might also require this. But this has nothing to do with burning CDs. Initiator identification is just a SCSI feature in general.

Thanks, eventually got round to getting it but it sure is slow. I
couldn't see a way of skipping direct to a page but I haven't read any
manuals yet so hopefully there is a way, maybe by command line.

I agree though with the person who commented about the font problems! I
tested it with a PDF 2 pages long and I'd really not like to try one of
these big electronics ones that are about 200+ pages long :)

To me, this sounds like some sort of buffer problem. Somehow your printer
misses the escape codes and thus interprets data as characters instead, until
it synchs up again.

Does your NVDI spooler partition have enough free space on it? You could also
try switching to foreground printing in the printer CPX.

It was TOS 1.6, 1.62 was the last STE version. 1.6 was a rainbow tos, too.
tos 1.0 was rom tos, 1.2 was blitter Tos, 1.4 was rainbow tos, and I forget
the rest.

it goes like this; 1.0, 1.2, 1.4, 1.6, 1.62, 2.05 and 2.06.

And no possibility to write one: the crusoe's internal VLIW code is
undocumented. Transmeta sells their chips as i386-compatible complete sets,
with the emulation built-in, "no user serviceable parts inside", so unless
this changes, there is no hope to get a code-morphing translator for m68k
code.

Mind you we are not talking about 16 colors but of 15/16b, 24b and 32b
colors. AFAIK GS can't cope with these color modes. In 15/16b color mode
I got some very disturb display but on 24b color mode all what I saw was
an blank page.

Motorola recently announced a 66MHz Dragonball. This is from the "old"
generation, with a 68k core. The new generation is supposed to have an
ARM-core (200MHz++) with a 68k-emulator for backwards compatibility.

729. 520ST questions...

Newsgroup: comp.sys.atari.st
Date: 2001-06-19 19:20:01 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1010619161450.7B-100000@halifax.chebucto.ns.ca>
Source record: 44696

Two questions re: the 520ST and disk drives:

1. Can the internal single-sided drive simply be replaced with a double-sided drive and the 520 treat it as such or will the 520 treat it as a single-sided drive and need some internal revisions prior to seeing it as a double-sided drive?

2. Can a 520 (single-sided internal drive) use an external double-sided drive as a double-sided drive or will it treat it as a single-sided drive regardless of it being a double-sided drive?

Sorry if this seems like double talk (or is that single talk?) ;-)

Thanks...

734. Calligrapher

Newsgroup: comp.sys.atari.st
Date: 2001-06-19 21:31:57 UTC
From: Bob Friend <nixmith@btinternet.com>
Message-ID: <9gog6g$3kv$1@uranium.btinternet.com>
Source record: 44702

Some years ago I used to run Calligrapher Wordprocessor on my ST - in fact I fired it up the other day for nostalgic reasons, it was a pretty neat program. One thing I did like was the IDEAS module - this was a sort of tree-diagram thing geared up for planning and organising ideas.... Does anyone know of a similar PC program that exisits today, ideally shareware ????

Thank you

BF

Im saying excluding m68k from "new clone" pool is bad move.. m68 did
serve us good, still does and still could (060 primarily):

PPC : nice cpu, not too fast in emulation mode, not 100% compatible
CF : how compatible? How fast with emulation which IS needed
Intel: wont even comment that

060 : could still offers great perfomances with good deisgned machine,
dont know for u guys, id want fast GEM machine + hopefully as much
compatibility as possible, thats why im very excited about CT60
project.. i dont need PPC for fast movie playing, divx and such stuff and
clumsy half compatible GEM. Note, apps prolly wont be developed exactly
for CF or PPC...

Bottom line: excluding m68k and including Intel in New Atari Pool is let
say not tasty alteast!

Janez

P.S. No real offence meant to poll people, just a bit bad taste: do we
realy forget good things so fast....

I was impressed with Revolver. I'm sure it won't run on an STe, tho'.

I had it installed on my Mega 4. Simply put, it ran automatically at
boot up, installed itself, then forced a reboot, keeping itself in
memory. Then, IIRC, with a preset keyboard combo, you invoked Revolver,
and you could write the contents of RAM to a hard disk file. Even in
the middle of an operating program. You could eventually set up
different RAM files for different programs, then load the RAM file you
needed. It was always faster than booting most programs.

I don't know of a specific program, but you might check out tucows.com
and zdnet.com. Both have good freeware and shareware downloads.

It will work with double sided drive without changes, except some plastic cutting to accomodate different eject knob position and shape and different disk hole height. I usually use PC's floppy in ST with excellent results. If you are about to use PC's floppy, jumper it to work as drive 0 (not drive 1 as default)

Regards,

Branko

Hey guys,
I recently obtained a SyQuest 44 drive with an ICD host adapter... and my fading memory is causing me problems with getting this thing running :P

Right now, I'm using AHDI, and it can see the drive... however, I'm not sure what drive letter to assign to the drive (I already have a 40 meg drive with C-F partitions, assigning G didn't work), and if there are any additional steps necessary to get this thing working (drivers, config files, etc).

Any help would be greatly appreciated!

Larry

The drives letters are usually assigned in ascending order by the hard
disk driver. The user cannot influence this, at least not with AHDI.
With other drivers, in particular HDDRIVER, the user can assign any
driver letter (even A: or B:) to a partition on a hard disk drive.

You _might_ find something of interest in the TTPs which accompany the
distribution. Also, in case you didn't know, you can rename with a PRG or APP
extender to have it run as a GEM app.

English docs/resource file from my web site (MISC section) in case you need
'em.

Actually, the code morphing software is stored in FlashROM. A premade
system could have the FlashROM replaced with a 68K emulator + Atari
virtual machine rather than the x86 + PC virtual machine.

>a double-sided drive?

Yes you can just change the 360k drive for a 720k, you may have to make
some modification to the uppercasing as the eject button usually is
different, unless you get one from another ST.

It will be treated as a double sided drive and not a single, and you can
read disk that are both singles and double sided.

You can upgrade to a 1.44 floppy, but some soldering may be needed and a
small software patch as well.

>
>2. Can a 520 (single-sided internal drive) use an external double-sided
>drive as a double-sided drive or will it treat it as a single-sided drive
>regardless of it being a double-sided drive?

You can use an external drive with no problems. These can be 5.25",
single sided 3.5" (360) or a double sided 3.5" (720k).

As long as the external drive if for an Atari ST, you should be ok.

Yes. But Transmeta is the only one who can actually write such an emulator,
since they don't document the inner workings of the chip. And it does not
look like they would be interested even a bit - after all, the volumes are
much too low for such a development.

So for all that matters, the Crusoe is just a nice, power-saving
x86-compatible chip. It does not matter that there is a VLIW core with a
translator inside, since you don't get access to that level.

Hi all,

New AtarICQ version

The most beautiful instant messaging programme existing for the Atari plateform is now available in a new version. It is now available in 6 languages and works with STiK 2, STinG, MiNTnet/MagiCnet with the corresponding GlueSTiK version! It works with N.AES as well as with MagiC and is also compatible with XaAES!

Besides the registration directly to the authors, it's also possible to get your key via Europe Shareware for only 21.50 Euros.

http://www.europe-shareware.org/atari/logiciels/ataricq.html (French)

Best regards,
P. Ricard (ES)

Hi,
Can someone point me in the right direction (doc, etc.), or just explain
how to use diskcopy images with the Atari Emulator NoSTalgia?
Essentially, I have a sample editor program for the Atari and all I have
is a mac. I've downloaded the editor and extracted the files (.prg, etc.)
but I'm not sure how to get the emulator to mount (?) the diskcopy image
to then launch the editor.

thanks in advance,

(can you reply directly to "kram@yorku.ca" since I don't get on this list
regularly (okay, never) and might miss the reply if it comes back to the
list)

thanks in advance,
ken.

Steve,

Well I went and looked and its called the BLITZ copier. You an get the software from http://www.umich.edu/~archive/atari/Diskutils/dupltwix.lzh and the instructions for making the cable are there as well.

I suppose that's not really correct as the data from the disk is "digital". Basically it copies raw data. The cable connects the "Read Data" output from one disk to the "write data" input on the other. Then by pulsing the "enable" (May be "Drive Select" don't have manuals to hand) and comparing the timing of the index pulses you can get both drives spinning at the same speed. All you then need to do is activate the "Write" line on the second disk for one rev, and hey presto you have copied a track.

Might be worth a try on those license disks...

Dave.

DiskCopy is used to mount the hard disk images. The files HDD-C & HDD-D
are compatibles with DiskCopy (20Mb DOS format).

Just create a ST HD partition. Be sure that NoSTalgia can use it.
Then quit the emulator and drag&drop the hard disk image onto DiskCopy.

You can now copy your program your files/programs on the hard disk
image.

Unmount the diskimage and relaunch NoSTalgia.

You can do the same with 720k DOS disk images, both compatibles with
DiskCopy and NoSTalgia

The biggest problem the blitz has, is that it isn't very accurate at
all. You can get some tracks that haven't been written properly and are
totally unreadable.

Also it needs two disk drives.

Syncro Express is slightly better, but is very slow for verifying.

I made a cable up years ago, before power computing started started
distributing it.

It isn't very good at rnc copylock protection, at all.

Not too sure about that. Decide for yourself, of course, how accurate or useful this info is, but the Tempest designers believe the 200MHz 603e to be as fast as a 100MHz 68060 (which don't go that fast, do they?) with their software which translates 68k code into native PPC, saving it in a new file, thus allowing Atari software to run nearly full PPC speed. How fast would a G3 or G4 be with this scheme? Or even at that, the G3 is a ton faster than the 603e (I forget the exact numbers, but I believe it's on the scale of 200-something MIPS vs. 700-something MIPS), and the G4 is *much* faster than that. I think even with emulation, the G3 or G4 could outperform a 68060.

Compatibility depends on your emulation or translation code. If they can make good, fairly compatible ST-emulators for PPC-based Macs, why can't they make good, very compatible 68000 emulators for PPC-based Ataris?

> 060 : could still offers great perfomances with good deisgned machine,

> for CF or PPC...

Which is why I like the idea of the code translation method that Tempests suggests they have. It allows us to "port" our software to PPC code with minimal effort. Once there, we can theoretically update our machines with the newest PPC processors, thus keeping up with the rest of technology, more or less. At least more that we are by using the 68k line.

> Bottom line: excluding m68k and including Intel in New Atari Pool is let
> say not tasty alteast!

This I do agree with. I personally have no real love for Intel. But that's just me. I'm sure there are others with the opposite opinion.

The thing I don't like about the 68k idea though, is that there are limitted numbers of these processors, meaning we'll eventually run out or be extremely hard to find, no upgrades when it becomes too slow, there already are 68060 machines available so why re-invent the wheel, and if we don't migrate to a newer CPU, we'll basically doom our platform to permanent obsolescence and slowness. I mean, they say that CPU speeds basically double

ever year or two, which means we're being left behind at an exponential rate
by staying on the 68k line. I'll take a PPC-based Atari any day!

Should be plug&play, boot the machine and it should appear as 'g'
on it's own. AHDI will stop scanning the scsi bus at the first
ID that timesout. Make sure you have a disk in the drive
as I don't think AHDI will see it correctly otherwise.
If you are gonna use the machine for any serious work it's
worth investing in HD Driver. It's alot more flexible,
can skip ID's and even allows you to boot with an empty drive.

Disable the TSL line in magx.inf and check for conflicting auto folder
progs. Boot a total clean system (no acc's no other auto prgs, cpxs) and
see if it works and slowly add back programs one by one.

The C-LAB has hardware patchs so it can't be to do with clock patch that
is needed on Atari Falcons. Try the above and see if that helps.

You didn't look very good: A quick search with Google shows "Martin Backschat's Homepage" at:

http://wwwzenger.informatik.tu-muenchen.de/persons/backscha.html

The "Profile" link mentions FastCopy:

"From 1984 up to 1991 I developped and sold software for the C=64 and Atari ST, especially the communication package 'Commic 64' (best-rated in diverse magazines) and the disk copier 'FastCopy ST' (best-rated PD- and commercial program over several years)."

Now, that's funny! If Adobe reader is considered as THE universal PDF reader
and it complains about a file then how can a mere mortal read it?

Btw, just the other day I tried something called XPDF (an X-11 PDF reader on
AXP/VMS) and it disgustedly refused to read some PDF files which it said were
PDF V1.2 while the reader supported V1.1...

I think we've been down this road before, but I can't resist...

1. The 68060 is no longer made, it's hard to find and when you find one
it's extremely expensive.
2. Any modern PPC or x86 with a decent 68k-emulator will be more
68000-68030-compatible than the 060, while at the same time support the
040, 060 and the various FPUs.
3. A 68k emulated on a PPC or x86 will be many times faster than a 060.

To sum it up, the 060 is by far the slowest, most expensive,
least reliable (in terms of availability) and least upgradable (it *can't*
be upgraded...) CPU one could possibly choose.

And if you can live with a x86: The cheapest and easiest way of making a
new, superfast clone is to buy a batch of ordinary x86 MoBos, add a
68k-emulator and TOS to the BIOS and start writing drivers. Or put the
68k-emulator on disk and use any PC, e.g. the 300MHz PII you got for free
when your brother upgraded... I could live with this, it would be just
like a Milan, only available... (and cheap, fast, upgradable and
repairable)

That I don't know. I would think it unlikley as the later machines
(Falcons??) had IDE drives as standard. I see main problem is that
you have to go to TOS2.0x which would kill many games I still enjoy.

Dave.

I'm trying to work out what you are trying to say.

The computer has several ways to read the contents of a disk. Via
gemdos, bios etc and by directly using the fdc (floppy disk controller).
Some programs use raw data as their protection, and by accessing the fdc
directly you can do all number of things, you can't normally do using
the file system structure.

I have a Compaq 5301 and I am trying to add a slave Western Digital IDE 60 Gig hard drive. When I got into my BIOS for setup, I don't have any options that let me setup a hard-drive. It is a chopped BIOS, Unicore Award BIOS from 1999.

My question is how the heck do I get it to recognize the new drive. Does it have to be the master drive (i.e. the only drive) or do I just need to get the BIOS upgraded. Of course, Western Digital says call Compaq, Compaq says call Unicore, and you guessed it, Unicore says call Compaq!

Any advice????? Thanks.

Well, I'll start by saying "Wrong Newsgroup" but here goes.

I have a Maxtor 60gb Hdd and I have had to upgrade the bios of my machine to
on produced in march this year to allow the isk to be used properly!

The hard disc shouldbe recognised but if the bios can't handle it it should
say it something like an 8gb.

Have you set the maer/slave jumpers ?

You may find that it is like my old Dell, This will only allow one hdd and
one CDrom. Two hard disc's don't work.
This is due to the bios being pruposly limited.

Unfortunately I would be suprised if a bios of that age would allow such a
big drive and IF you can get it to be seen then you may have to use some
special software to format it in some wierd and wonderfull way.
If you drive is OEM (drive and bag maybe a small leafet manual if your
lucky) you won't have got this software so you will have to download it.

Try it on it's own and pray that it sees the entire drive. If it doesn't,
see if the software by WD will format it for you.

Oh and by the way, Compaq may have released a newer bios for your machine
since then, They even had a bios written last year for my old 486 desktop to
enable Win2k to run.

Hope this helps

Tim

Great! All u need to do is to buy Mac install MagicMAC and that is
then! U will have 060 outperforming machine then... And personaly i
wouldnt ne happy at all, if 700 something MIPS (Meaningles Indication of
Processor Speed) will outperform 060.. Remember PPC Mac's? Slower as
Quadra 040.. I agree Tempest's method is way better, but duplicate all
program files? How big duplicate will be? What mess ill have on HDD (Atari
ppl are one of rare who still know what and why is on HDD). What if i
upgrade app? Deleting apps may become a mess.. I dont say it will be bad,
im saying solution is not to elegant in some areas.. Also CT60 use 060
with given speed, VERY fast bus and FastRAM acces, Tempest PPC speed is
yet to be seen...

> Compatibility depends on your emulation or translation code. If they can

Im not against technology. I do think that keeping with it at any cost
is not good.. Im Falconeer.. I dont use only proper GEM apps, lotsa apps

im happy to use (Apex media, Neon, ESC Paint, SID Player ...) dont run on compatibles such as Hades/Milan.. Also MiNTs virtual consoles dont run on those, i cant live without them.. Not to mention demos.. So better techology used on Hades (for example) is of no use to me..

Apex media is great app, i love it more as let say Papilon, which wont be any beter on some superfast clone.. just faster. Personaly i want those nongem apps as well, thats why my dream machine is ct60 falcon with promised PCI bridge.. So we can have AES on gfx card and virtual consoles at same time on Videl gfx, same with Apex etc... dual monitor system.

Well did any of u thought of lots demo coders, who still keep Atari scene going, and other ASM programmers, like OZK from assemsoft.. Imagine those ppl sweating over Intel or any other ASM?

Janez

This is what I do on my Eclipse equiped Falcon. I have a VGA monitor on the
Eclipse and RGB on the Atari. Works great.

Hi,
If it uses the same mouse as a normal ST, you can check out Mario Becroft's
Mouse adapter on: http://gem.win.co.nz/mb/
It makes most serial PC-mice work on the mouse port of the Atari - a really
great product :)

Best regards,

Hi Ken,

The Y2K bug of XBOOT is fairly minor in that certain features don't save correctly after 1/1/00. Kindly set your clock for 1999 before playing with XBOOT and set it back when completed. (Actually, my version of XBOOT works fairly well without doing that, but perhaps I'm just lucky.)

As for your SLM problem, I suspect that it can be solved. Many TT owners used to use the SLM. Is it possible to use a HD off the SCSI port, thus leaving the ASCI for the SLM alone? Having owned a SLM for only a few months, I don't remember much about it save that it sure pulled a lot of watts!

Galen

788. New MyMAIL version out now

Newsgroup: comp.sys.atari.st
Date: 2001-06-21 05:56:10 UTC
From: epkerha@epk.ericsson.se
Message-ID: <9gs29q$l9$1@newstoo.ericsson.se>

```
Hi all !

New version of MyMail (1.40) at my homepage.
http://www2.tripnet.se/~erikhall/programs/mymail.html

Some of the changes, bugfixes and so on:
----------------------------------------
- The code for outgoing mail queue is totaly redesigned.

mapS by Gerald Dietze is updated and synced to changes.
update can be found at:
-----------------------------------
http://gerald-dietze.de/dsi.html
The new mapS will also run with older Versions
because it's checking the program version.

- Added CPS in progressbar for mail download.
Estimated total download time and time left is also presented.
- Replaced all the old popup menu code with the new one.
- A missing check of error message added and this solves problems
with some mailservers (smail).
- Fixed a bad and old bug that was causing mymail to crasch if there
was very long To: fields in a incomming mail.

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
! !
! This is only a minor part of the changes, bugfixes and so on. !
! Please do read the history file that is more complete. !
! !
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Please read the history and docs regarding
bugfixes and new functions or changes.

-----------------------------------------------------------
You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.
-----------------------------------------------------------

If you find any problems with MyMAIL please let me know.

Thanks to all of you for all the help i get from you all.

Best Regards
Erik Hall

On my old 450Mhz PII at work, GEMulator ran at about 25x the speed of a
TT. Take a look at what kind of x86-processors you get now...

And please note that this was an *ST-emulator*, a new platform with real
drivers and only an emulated CPU will be much faster and more reliable.

It's not MiNT but the hard disk driver that is responsible for accessing
IDE (and SCSI) drives. So if there are problems with IDE drives and MiNT
there will be the same problems without MiNT. MiNT does not include any
IDE code.

You don't get the point. All the emulators currently in use simply run on top of another OS (in most cases this means Windows), which reduces the emulator to a toy for nostalgics. Windows/Mac software is better than their TOS counterparts in most aspects, it doesn't make sense to use these inferior programs when you already have Windows running.

A new x86 (or PPC for that matter) based clone would have to ditch that slave OS and boot straight into a 68k-emulator, which then boots the real OS (e.g. FreeMiNT). The only real problem here is a religious one - die-hard Atarians would rather pay $$$ for a PPC-based (still emulating the 68k mind you!), weird computer that only the chosen ones would be allowed to buy, than buying a much faster and cheaper computer in the local store, even though this computer does the exact same thing only better.

> anyway. About Milan: YesCREW has it, im not impressed AT all!

Not very fast, right? I'd suspect that any 1.5GHz piece of silicone from AMD or Intel would fix that, even though it had to run a 68k-emulator...

I believe you're in for a big surprise when you get that 060, and it's not
a good one ;-) It's less 030-compatible than most emulators. Basically,
you can't upgrade your Falcon without loosing something, and with your
selection of software I'd say that you better leave your Falcon alone, and
instead buy a second computer if you need more speed.

> Well did any of u thought of lots demo coders, who still keep Atari
> scene going, and other ASM programmers, like OZK from assemsoft.. Imagine
> those ppl sweating over Intel or any other ASM?

Why would they? A 68k-emulator would still emulate fresh code, not just
old sh*t ;-)

Anyway, the Amiga-scene seems to be happy with their PPCs, even though
most (all?) of their PPC-cards are pretty sad. The nostalgics - those that
play Worms on their A500 but does everything else on their latest
Wintel-box - are the only ones that complains.

Joining on to this thread with another HDDriver problem...

I've been using V7.71 very happily with my Centek CT2'd Falcon for ages. Then I upgraded to 8.03, and that too worked very well.

Then I wanted to return to 7.71 in order to try and track down a problem I found when transferring large files from one SCSI drive to another. Problem! HDUtility for 7.71 refused to run, complaining that it "Couldn't load driver file"! What's going on here?

In the end, I managed to install it by switching to Falcon mode, but it stil won't run under the CT2.

FamilyNet Newsgate

This is in reguards to my website at...

http://www.geocities.com/lady-aramis/atarinewtonmod.html

This site is devoted to making the tunes of the Atari computers and games available on the Newton MessagePad, since, after all, the best home computer works best with the world best PDA. ;) On this site there are zipped mods already in .pkg form, as well as raw mods for downloading and converting on the fly for Newt's Cape users, and a few mods thrown in that were not neccessarily Atari in theme but cool anyway. :)

So pay it a visit! All the contributions back in September were ones donated by various users from the Atari newsgroups. The recent change was when a midi and mod archieve (of, oh, about 101 megs worth of music) recently opened back up. So I'll be sorting through those, posting some new mods up on my site every so often, ect.

So .mod fans, stop by when you get the chance!

Doctor Clu
Atari / Newton User

PS: Those that have geocities web accounts, anyone figure out how to upload a Newton file in it's unzipped .pkg form? I would love to have my Newton files up there for Newton users to just grab without the aid of a desktop.

Thanks in advance!

I use a TOS switcher (1.62/2.06 from TUS) so I can revert back to old TOS
for games. OK, it doesn't auto boot the HD, but most games aren't
installalbe onto the HD.

Mint ran fine with my IDE drive on my STe. And same with Falcon AFAIK.

I maybe not get the point, but runing emulating code on top of some system is almost equaly as runing same emulating code as basic system... Some loose of speed in 1st case, but then again, u can also run Macos on same machine without probs.. And believe it is NOT religic things, its just devotion... I like Ataris, their way of working and feeling.. A machine u described wont give me that, clone NEED to be also compatible with some hardware, to have certain hardware, not to be a PC and emulate CPU.. Thats exactly why i dont like Milan. Compared to Hades there is no sound at all, no YM chip (well im weirdo, i love it)... U can get some kind of sound, which is bad and maybe there are 2 apps which kinda works.. Hades is a lot more compatible.. To use an analogy:

new WV beetle it is NOT WV beetle at all, all real VW beetle fans are disgusted with it.. no feeling, no joy, no nothing.. i guess we die hard atarians (that almost starts to be bad word, heard from ur mouth) are the same...

As i see the problem:

We are called die hard Atarians, usualy as kinda "breaking" force, romatinc fools... On other hand, do u guys consider that only TOS and straight GEM apps are "Atari"? What about Paint apps, Trackers, Games, Demos (i know ppl dont like demos, still look on c64, XL .. scene, for years they survived just because of demo ppl and their devotion, ups,

their lack of flexibilty to use some crazy emulating cpu). There is just so much good stuff u are willing to forget, just to heal i could already say a complex, regarding mhz etc..

> > anyway. About Milan: YesCREW has it, im not impressed AT all!
>
> Not very fast, right? I'd suspect that any 1.5GHz piece of silicone from
> AMD or Intel would fix that, even though it had to run a 68k-emulator...

Wrong. Not very Atarish... It runs MiNT nicely, im very happy bout that, we run server on it for years now, proper server for few ppl (ssh, telnet, ftp and www servers), vido also use it as his main machine.. Also it run GEM stuff nicely. UNTIL they are 100% right, or until all is xbios etc driven.. Read: no sound apps, no games, no non gem (capable stuff!) apps, no fun i would personaly say.. I dont seek for 100% compatibility, u cant reach it.. but Milan runs 0% of those stuff...

I will end this debate with describing myself: My mind is not all about speed and mhz.. I love Ataris as they are, i wana feel them.. for those SUPERIOR things u talk about, i can buy PC or MAC.. I will NOT push Ataris into something they are not! And u say MAC/PC have superior apps, so what good we will have with our inferior apps, if they will only run faster? BTW check papyrus, i dont think its exactly inferior. My Falcon can run mp3 with ease, i personaly saw superior G3 chocking (not cpu prob though).

And how much Hades/Milan apps were developed in those years? I mean apps that could realy use of their power? Falcon poped out, and there was lotsa progress and lotsa apps emerged, and still does (apex, famp, esc paint and so on), same was with STe and TT , but i dont see much apps "aligned" to Hades/Milan gfx/cpu power...

Hi Hurfy, long time no see. Why not use a serial PC mouse in the serial port, all you need is a driver and it should be a-ok;-). For ten bucks it should be a good solution, after all it is a PC. If you need a driver let me know.

Mark

PS picked up a Jag today from the US, will bring it in for a demo soon.....

It's a double edged sword... people holding on to old apps and
old ideas is part of the reason why you don't see apps "aligned"
to these faster machines.

I use my yanaha chip for a keyclick... ;-)

>it's extremely expensive.
>2. Any modern PPC or x86 with a decent 68k-emulator will be more
>68000-68030-compatible than the 060, while at the same time support the
>040, 060 and the various FPUs.
>3. A 68k emulated on a PPC or x86 will be many times faster than a 060.

I'am not sure because I have an exemple who a Falcon/CT2 (68030/68881 50MHz)
is more fast than a Mac with a PPC604e/300 MHz under MagiCMac/PowerFPU.
My example is Lame MP3 encoder who uses lot of FPU instructions:
The original file is an intro, a .WAV 44100 Hz 16 bits stereo of 8 seconds.
I must wait 5 mn with my CT2, I know it's slow.
Under the Mac with a PPC604e you must wait 7 mn, and the emulation PowerFPU
is faster than SoftFPU.
The FPU is very slow, so another used has tried a version without FPU
his machine is an iBook... 15 mn with only the 68020 emulation.
No comment...
I wait the results with an hades, maybe 10x more fast ;-)

I have another exemple...The lastest AVI files who contains DivX
and MP3 audio track, you want try to test it under your PPC emulation ?
No problem I can send it, I know your answer... It's very slow
and if you remove the MP3 audio track, it's always very slow.

>To sum it up, the 060 is by far the slowest, most expensive,

Only more expensive.
Today the emulation isn't a good way, in this conditions the 060
is _THE_ way. Sure if you found a PPC at 5 GHz, the emulation is
a solution for all cases.
Today the Dream Machine for me is the CT60 (like the 060 for the DivX
and the DSP for the MP3).

Regards,

Didier.

Yes, sometimes I feel that we should not be trying to make an Atari do
what a PC does but make it do what the PC can't. For instance, a new
RiscOS machine has been launced that only takes 8.5 watts of power
including monitor. This can be run off solar energy and still is quite
powerful, 128Mb or RAM, USB, ethernet etc.

Methinks you have grabbed the problems at the wrong end and with wrong tools.

All mentioned chips are fine, but are not meant for this particular use. 68K series would be cool to see in some new implementation. Intel might be making manuer-compatible products, but they have AMD, Cyrix etc. to keep the competition active,
and MC has no competition. Otherwise, chips like sledgehammer would also be available in 68K flavour.

I'm thinking about emulation, but with some modern DSP. When not working at dayjob, learning linux, I am working on making 68000 emulation with ADSP-2192. It's a real pitty that main development tools for it are quite expensive, since chip is pure poison. Small, fast, simple and has 100% of needed qualities for the job. I mention it because I think it would be a good start.
Once if idea catches up, one could make something with TigerSharc or even bigger ;o).

PPC, x86, Transmeta etc. are mainstream products. I don't think they are optimal for Atari emulation.
Correct me if I'm wrong, but I picture modern Atari as a small, slick, cheap but fast and agile machine. Those chips are material for bulding dinosaurus, not jaguar. Nice thing about DSP's is that some of them have multiple execution cores, so one can divide chores between cores (one fetches instructions into cache and deals with related issues and other for internal calculations etc..) and that their SRAM is big enough to hold CPU emulation code inside, plus emulated cache and eventual MMU tables.

Just a few thoughts,

Regards,

Branko

The difference is huge. Running e.g. MagiC-PC on top of Windows might
work, but you still have that huge lump of code called Windows to manage.

> things, its just devotion... I like Ataris, their way of working and
> feeling.. A machine u described wont give me that, clone NEED to be also

> get some kind of sound, which is bad and maybe there are 2 apps which
> kinda works.. Hades is a lot more compatible.. To use an analogy:

A reasonable fast PC would be able to emulate any kind of Atari hardware
you like, at a very low cost and with great speed. E.g. emulating all of
the Falcon's hardware wouldn't be a problem at all. You could even run a
proper ST-emulator under TOS/MiNT/whatever and run all those old ST-games
(in a GEM-window if you like), something you can't do with a Falcon or TT.

> Demos (i know ppl dont like demos, still look on c64, XL .. scene, for
> years they survived just because of demo ppl and their devotion, ups,
> their lack of flexibilty to use some crazy emulating cpu). There is just

These systems - and now partially 68000 Amigas and Ataris - only lives as
nostalgic toys. I want to *use* my Ataris, not put them on display and
play the occasional game (or watch a demo).

> so much good stuff u are willing to forget, just to heal i could already
> say a complex, regarding mhz etc..

Old stuff can easily run on an emulator too. In fact, when I want to play
games I use PacifiST on my PC instead of my real Ataris, because none of
my real (working) Ataris are ST-compatible.

>> Not very fast, right? I'd suspect that any 1.5GHz piece of silicone from
>> AMD or Intel would fix that, even though it had to run a 68k-emulator...

> Wrong. Not very Atarish... It runs MiNT nicely, im very happy bout

It has faster graphics and disk-access than my Falcon, but a slower CPU. I
want something drastically faster.

> it run GEM stuff nicely. UNTIL they are 100% right, or until all is xbios
> etc driven.. Read: no sound apps, no games, no non gem (capable

> stuff!) apps, no fun i would personaly say.. I dont seek for 100%
> compatibility, u cant reach it.. but Milan runs 0% of those stuff...

A reasonable fast PC (like the 500MHz PII with 256Mb I'm getting for half the price of my Eclipse next week) is able to run virtually anything that runs on a ST or STE. Is somebody working on a Falcon-emulator?

A clone with a fast CPU can easily emulate everything you need to run virtually every piece of software ever written for Atari's 68k-machines. This is something a 68k-based - even a 100MHz 060 - clone can't do.

> into something they are not! And u say MAC/PC have superior apps, so what
> good we will have with our inferior apps, if they will only run faster?

With more CPU and RAM one could write or port better apps. What about The Gimp under GEM/X? Or Netscape (a crap web-browser, but better than our alternatives)? There's a lot you can do with more power...

> And how much Hades/Milan apps were developed in those years? I mean apps
> that could realy use of their power? Falcon poped out, and there was lotsa
> progress and lotsa apps emerged, and still does (apex, famp, esc paint and

Can it have something to do with the userbase?

Then the 68k-emulation must be poor, or the emulator isn't allocated
enough CPU.

>>To sum it up, the 060 is by far the slowest, most expensive,

> Only more expensive.

No, it's the slowest. A decent emulator on a fairly new PC or Mac will
kill the 060, no doubt. The 060 is nice, but not fast.

> Today the Dream Machine for me is the CT60 (like the 060 for the DivX
> and the DSP for the MP3).

I'd like a CT60 myself (I've even ordered one), but when will it arrive?

NAT32 and that is the only Windows solution I know of that can use COM
ports as part of a LAN via ip masquerades (NAT).

I have a description on my home page (url in sig) on how to set it up.
It's sligtly outdated as there are new versions of NAT32 out by now but
the basic idea should still be the same.

>analogue copies?????

Why not? They are analogues of the original. Perfectly valid use
of the word, though most people will only think of 'analogue' as
the opposite to 'digital'. i.e. continuously varying instead of
binary quantities of whatever. More usually they are known as
'image copies' - that doesn't mean that you can look at them! :-)

Regards, /Peter/

It is an old story. "alignment" to faster machines always means that apps grow larger and become slower.

It is very difficult to withstand the temptation of loosening your grip on the efficiency of the code you write.

Apps that arent upgraded have at least the advantage that they will indeed run faster on the faster machines. So you can either run more programs together or enjoy the time you dont need to sit and wait before your computer.

The difference may be academic hair-splitting. I.e. if you can't feel the
difference then it does not matter. And doesn't even a Falcon, sort of,
"emulate" (afaik called "backward" or something like that) an ST for some
old programs?

Btw. Gemulator for DOS (demo on their site) is 32-bit code and only
about 10% slower than the one for Windows- and it comes close to a concept
which was discussed here earlier- use just minimum DOS to automatically
start the emulator when the machine is powered on. It is a pity that this
freeware demo is crippled to just four 32MB hard disk images, and it is not
clearly documented how to increase video resolution above standard, although
it appears possible and Gemulator for Windows does it (almost) fine.

John Klockars posted here several months ago results of some tests he did
(and as far as I can tell he makes those tests very competently). Results
said that Gemulator 2000 on his 650MHz PC was several times faster than
a Falcon with AB040. So the order of magnitude is about appropriate and the
above statement seems possible, depending on what someone means by
"many times", if emulation is done properly.

Superb! Add Word and few other apps and u dont need Atari anymore! I do
NOT wana run Netscape, or Gimp, or Word or Photoshop etc on my Atari! U
miss the whole point of liking certain machine, having special and
diferent machine here.. i do NOT wana make PC out of my Ataris.. ill run
my Falcon as long ill be able to, CT60 may extend that.. cause i just
love it, no need for Netscape, or other foreign apps. As u sad, u can get
PC for pocket money, run those there..

Why there are new and impresive apps out for Falcon then? Also why soon
after Falcon emerged, new capable apps were produced, not by companies, by
"freelancers" as well?

I don't mind a newere series of processors *IF* its gonna be 100%
compatible with the existing ST/TT/Falcon systems. Yes its a tall order
but thats what we really need in an Atari clone. Since I come from an
Electronics background I've worked on 68k and x86 processors down to the
nuts & bolts level and I can state with certainty the x86's processors
aren't up to the task, not even close. But there is hope, As I
remember Motorola had in their product line a series of
"microcontrollers" which were 68k cpus with several of the additional
support chips integrated right in the same IC. A couple of friends of
mine built a reasonably powerful single board computer around one of
these. If these are still available in quantity, they'd make another
good alternative for building a new Atari clone.

Actually, that's a limitation, not crippling. The commercial version
did the same thing.

That would be the 68300 series which is, indeed, a 68k CPU plus
some peripheral contollers all in one. Mean to work as a micro
controller, but could probably be used to make a _small_ TOS box.

I'll second that.

If Netscape, StarOffice... are ported to every obscure platform
out there, what's the point? What would be the advantage of
running GIMP on an Atari, instead of running it on affordable,
easily found and upgraded and _fast_ PC hardware?

My perspective is that multiplatform applications, while they do
improve interoperability, make it pointless for a planet to have
more than one platform.

> old programs?

It may be academic hair-splitting for u... But rethink carefuly: U want to make Ataris to be PC like.. Noone as i can see realy cheerish that Ataris are DIFERENT as PC, hardware and software wise, because of that Falcon on 16mhz can run mp3 player, Apex and such apps, while others cant... Thats just one example.. U keep mentioning (not u personaly, ppl to which i try to opopose) gemulators and its speed, HOW fast can it run let say Noise tracker, non-gem games, demos.. YES those are genuine ATARI programs as well, because of those, Atari earned its reputation.. We didnt have better apps as autocad, max3d, frameworks etc, we did have beter paint apps, midi apps, trackers, games. And thats what make ST a good machine.. We had dynacadd, ldw and other but they were always a bit behind PC apps.. What use we will have in runing papillon, photoline (i love that app) and others at 100 times greater speed.. they will do exactly same, nothing more, just faster, and they arent exactly slow now on TT, falcon, maybe CT2 falcon. I had many PC pals at time when ST was popular, noone came to see serious apps (i think Calamus was bright exception) they did like trackers, gfx stuff a lot! And now u all talk bout Milans, Hades's, Emulators and try to make us who just simply likethe machine as it is, even with faults, dummy? Im not against new stuff, but they should be special and different.. Branko said that best...

So it may be hair-splitting to u, its Atari to me! About Falcon: yes it aint 100% compatible, its was new machine.. STILL videl offers ST mode, ST pallete, they used a compromise with BUS to regain some compatibility. Backward just enable some stuff (timers) prevent crashes caused by diferent memory handling.. not emulating anything.. denying all stuff except pure GEM etc is denying the machine! As soon u have same hardware for diff OS-es, no matter if OS is started as main OS or on top of other OS, u did kill the machine flavor..

> make a decent graph. And a faster Atari would also improve Calamus,
> which I love.

Please explain me this: WHY is runing Netscape (or any other foreign app) on Atari such great thing... U can run it on PC, Mac. I was and still AM proud of our NATIVE apps, imho that define Atari as such.. How can u run Atari with netscape, excel, StarOffice and then cheerish Atari? Thats NOT Atari (or Amiga, or RiscPC) then.. Run emulator on PC use Atari apps and run Netsacape etc as well.. Im happy to run Papyrus, even CAB (not so fancy, but heck, it runs on TT or Falcon, no need for GHZ's), Calamus, Famp... Of course, i could run Word, Netscape, Calamus PC and Winamp as well (since u guys want those apps), but whats the point of runing those and claim "Im atari fan!"??

About language: neither english or german or french aint my native languages.. I adopted, so could u and use Texel for example.... It is dummy conflict..

It's MacOS 68K emulation.

>No, it's the slowest. A decent emulator on a fairly new PC or Mac will

Excepted when the 68k code is replaced by PPC code (like a tempest ???),
with a good emulator you need a PPC who runs 10X the processor to emulate.
It's a minimum.
A decent emulator not exist on PC, no 68020 to 68060 no FPU. There are just
ST emulators or games emulator. It's not a serious emulation.
An there are another problem with the emulation, today there are no memory
protection.

>> Today the Dream Machine for me is the CT60 (like the 060 for the DivX

Both what? (hint: learn to cite properly!)

In general proxy solutions are inferior and harder to setup compared to
real NAT networks.

Note that we are talking about LAN through the serial port. If this is
possible with Wingate, please confirm!

I have only read the Wingate doc's without installing it. I like to keep
my pc clean without the need to reinstall etc...

Its horses for courses. Some things work better through PROXY other through
NAT.

>
> Note that we are talking about LAN through the serial port. If this is
> possible with Wingate, please confirm!

WINGATE just talks to IP interfaces. Provided you can make the connection
using either
the Direct Cable connection "modem" or similar it will proxy. I use it often
at home for
PC sharing because it has a SOCKS proxy which can be usefull for some
protocols
that don't like NAT.

I would have thought that you could use the NAT built into WIN2K without
problem,
but the trouble with this sort of solution is that because MS hides so much
under the GUI
it can be hard to configure and debug when you are not using it in exactly
the way MS suggests.

I expect that you could also use LINUX, but again I know even less about
that, but from what I
have read elsewhere (on the UK.telecom & uk.telecom.broadband) most versions
comes with a built-in NAT.

> smaller!

I assume something like this can be done with a Dragonball and a couple of
custom chips. I doubt it can be made as small as a Palm though, 'cause if
you want it to be of any use you'll need...

a) a harddisk and preferably a CD-ROM or DVD.
b) ethernet.
c) standard RAM of some sort.

But I believe it can be done fairly simple and cheap, the only real
problem is that the Dragonball isn't particularly fast (the fastest is a
66Mhz 68000, no caches IIRC), it doesn't have a MMU or FPU, and the 68k
Dragonballs will probably disappear in the near future.

The point is that with a real fast CPU, you can easily run virtual ST's
(perfectly emulated, far more compatible than even the STE) in AES-windows
if you like (or in full-screen) under TOS/MiNT. A Falcon can't do that. A
Falcon can only run well-written ST-programs. A TT can't even do that.
Once you add a 060 (and to a certain degree 040) your Falcon's
ST-compatibility is close to zero, and it isn't even fast enough to
emulate a real 68000.

While at the same time adding more functionality. Like it or not, as
functionality and complexity increases, you'll have to use techniques that
are less efficient (speaking of execution time) just to finish the app in
your lifetime...

Under Windows or Linux? Blargh... If I had a really fast Atari running
MinT/N.AES (or MagiC, if that's the only alternative) and
DreamWeaver/Fireworks was ported, I wouldn't *need* a PC.

You can run any of these under PacifiST, WinSTon or any of the other
countless ST-emulators, on a fast PC costing less than the CT60 you're
waiting for. So why waste money on your Falcon??

> run Atari with netscape, excel, StarOffice and then cheerish Atari? Thats
> NOT Atari (or Amiga, or RiscPC) then.. Run emulator on PC use Atari apps

The Amiga-people do have a decent X-server, and they do run Netscape,
StarOffice and other stuff since they have the CPU to do it. If I want to
do it on my Falcon I'll have to run this stuff remote on a Linux-box, thus
reducing my Falcon to a dummy X-terminal.

A good emulator cache translated code (Tempest does that), which increase
efficiency a lot.

> A decent emulator not exist on PC, no 68020 to 68060 no FPU. There are just
> ST emulators or games emulator. It's not a serious emulation.

That's true, current emulators are toys. I'm not suggesting using one of
those either. You don't need to emulate the hardware (with the possible
exception of the MFP perhaps, like the Milan does), only the CPU. You'll
need proper drivers for the hardware.

A ST-emulator could be ported to MiNT to run old software, something I
wish could be done on my Falcon...

> An there are another problem with the emulation, today there are no memory
> protection.

Indeed. A fast 030-emulator would be needed. And a VDI (fVDI) with a
decent driver for a popular chipset (ATI), harddisk-driver, XBIOS
sound-driver for e.g. Soundblaster-cards, ethernet-drivers etc. It's a lot
of work, but less than developing new hardware.

I assume you're talking about the Dragonball. A nice chip with
possibilities, but too slow, no FPU and no MMU. You could build a small
and cheap ST, but it would be quite limited compared to a TT or
accelerated Falcon.

I keep hearing this and that cannot be done fast enough and frankly
I don't agree. Firstly I've not seen it tried yet. A machine such
as a Hades should be able to emulate an plain 68000 ST failry easily I
would think if done correctly. Most projects end up generic or protable
and so the performance sucks, like STonX. The MAC emulators had very good
performance on the ST line so why shouldn't something even closer such as
an ST, you even have some of the actual chips like the Yamaha right there.
Personally I'd like to see an ST emulator that ran on the Hades,
it would make my day to be able to run GFA-Basic in a window
on the desktop via a virtual ST.

Because it losses its feeling, it becomes boring, something that you can
never asscoiate with Atari. If you want to run ST games and the like, the
best way to do it is to pick an ST out of a skip, cheaper than your PC and
emulator.

>I'm trying to work out what you are trying to say.

Sorry I didn't make it clear. Fastcopy Pro has a mode that produces a disk image, which you can store on the hard drive and later copy back to a floppy. If it is a true image of the floppy, then I would have expected that it would copy the protection features as well (unless it was some mechanical scheme with burnt-in holes or similar). Although there was talk earlier about non-standard disk formats and tracks beyond the normal limit for some protection schemes, I don't see how this would work since presumably the computer has to read all of this with the original disk, else the program/demo/whatever wouldn't run.

What I didn't know whether this image copy relies on gemdos, bios, and/or normal file structures, or just uses the fdc to copy everything on the disk. I know many games etc didn't have normal directory file structures, as you couldn't see any entries when opening them manually on the desktop (the program autobooted). Presumably to autoboot the computer had to read the boot sector at least?

LATER: Having made tests, Fastcopy Pro seems to read track by track in image mode, the same as it does for normal copying. Also the image file is only 200 bytes larger than the original disk, so it can't be copying the sync bytes etc, which is where the protection may perhaps lie?

Regards, /Peter/

I suppose you can't modify a recent driver file (HDDRIVER.SYS) with an
'old' configuration tool (HDDRUTIL).

The inverse (old .SYS, new HDDRUTIL) may run, but if I remember
correctly HDDRUTIL will encourage you to update...

It can copy very primitive copy protection, where a sector has a certain data in it, and is marked as bad or not used.

I got ya.

It just seems to copy sectors and tracks only. I use the imaging for my pd library catalogue disk.

Using the happy computers discovery cartridge, there is a mode where it counts the timing between timings bits. These files can be larger than 4 meg each, great for hard drive users. But you wouldn;t normally have to copy a disk with ALL the tracks at that degree of accuracy, you would choose the ones you need to.

The biggest problem is the framebuffer which must be transformed and
copied 50 or 60 times each second. Also, you have to use an actual 68000
emulator, and not run 68000-code directly on the 060. The latter would
work, but the timing would be all wrong which kinda defies the entire
concept...

> and so the performance sucks, like STonX. The MAC emulators had very good
> performance on the ST line so why shouldn't something even closer such as

That's because they just patched the low-level routines in MacOS. I don't
think it emulated the Mac's hardware, or emulated the CPU.

> an ST, you even have some of the actual chips like the Yamaha right there.
> Personally I'd like to see an ST emulator that ran on the Hades,

Exactly :-) But I don't think your Hades is fast enough, but I would be
very happy if somebody proved me wrong...

Not so sure about that, old ST's has a tendency to fill closets and
collect dust. Anyway, my point was that Atari-users are different, and
that there's quite a large amount of us that would rather have a fast,
modern GEM-box and not necessary a pile of hardware that mimics the ST or
Falcon. I already have several STs, a hot-rodded Falcon and ditto TT, so I
don't need something similar. I just want something that's faster, has
fast graphics, fast disk, huge amounts of RAM etc.

I don't think the Spectre or Aladdin emulated anything, IIRC they patched
the low-level routines in MacOS to use ST hardware.

That is true. All these 'visual' development systems do that for you.
I have played around with Borland C++ builder for a short while.
With a few mouseclicks you have programmed a fully scrollable and moveable
dialogue. Very nice, especially when you have already done this in a GEM app.
You pay a price. Which keeps the economy going. :-)

So where do you draw the line? You must understand that with the shrinking
userbase and fewer and fewer developers, we *need* to be able to use
multiplatform software if we want new and exciting apps for our beloved
system. If we just settle for yesterday's news, our Ataris are nothing but
toys used only for nostalgic reasons.

> im out of this debate, i wont hear that just because i love Atari machines
> more as some emulators.

So do I, and I don't use emulators except for playing games. This debate
is getting a bit off track, my point is that instead of developing a new,
slow and expensive pipece of hardware, we might as well use existing
hardware. I don't want Windows, DOS or any other OS in the background. I
want a box with cool hardware (which the PC has plenty of) that runs my
favourite OS and applications really fast. Just think of all the fun we
could have with e.g. 3D-apps and demos, TV-cards, raytracers, sound-apps
etc. with new hardware. And no Windows or MacOS in sight...

Another question is where you draw the line between emulators and the real
thing? If you want a new and slightly faster machine that supports the YM,
MFP, DMA, Videl etc. in hardware, it has to be done by emulating them in
some programmable logic chips. And to be able to run your old software you
must emulate parts of the 68000 instruction set, since the 060 doesn't
support everything.

Hi all,

I'm hoping to find a reasonably priced ST with at least 1 meg of RAM for sale in the US. I only need the CPU unit and mouse. Any 520ST upgraded to 1 meg, 1040ST, Mega ST, etc. would be considered. Please Email me care of drichard@execpc.com with details and price.

Thanks!

Dean

> NOT wana run Netscape, or Gimp, or Word or Photoshop etc on my Atari!

Personally, I don't think being able to run Netscape on my Atari means I don't need an Atari any more. Quite the contrary. I think it would be very cool to be able to "steal" these beloved apps from the PC/Mac world and run them on the Atari much more than running them on PC or Mac. It's the total environment that the apps run in that's important, at least to me. Running Netscape wouldn't make TOS, Magic, NAES, etc. act just like Windows or MacOS, would it? Not at all! If we can port these things to the Atari, that means more goodies for us! Then people could maybe use their code to gradually make something better, or be inspired by their bulk to make something faster. Until then, we could run a browser that works much better than our Atari alternatives, while keeping the character that the Atari operating systems offer.

> U
> miss the whole point of liking certain machine, having special and
> diferent machine here..

A different machine that won't run modern applications because it is way underpowered...

> i do NOT wana make PC out of my Ataris..

Which is impossible unless you get a PC emulator...

> ill run
> my Falcon as long ill be able to, CT60 may extend that..

As would any faster CPU, 68040/060, PPC G3/G4, PII/II, etc. But compatibility will be decreased in *all* cases unless you have a darned good emulation or can revert back to the original 68030 for old programs.

> cause i just
> love it, no need for Netscape, or other foreign apps.

Well, ok, if you don't want to web browse with your Atari (at least browsing on the increasing number of sites that CAB won't go to). I would personally much rather have a PPC-based Atari running Netscape than a slow Atari and a

PC running Netscape, MIE, whatever. Even though I have a G3 Mac now, I yearn to see the day when a good, ultra-fast Atari is available that can run a fast, well-equipt browser, and make my need for this Mac nonexistent.

> As u sad, u can get
> PC for pocket money, run those there..

No thanks...

> You can run any of these under PacifiST, WinSTon or any of the other
> countless ST-emulators, on a fast PC costing less than the CT60 you're
> waiting for. So why waste money on your Falcon??

U really dont get the idea do u?? Ill tell u why:

1. I do not own a PC or MAC
2. I do not wana spend 2000dm on PC or MAC to run emulator
3. I do not wana have a PC, then run emulator for GEM apps, another one
for games or demos, another one for those games/demos which dont run
on previous emulators..
4. No emulator gives the feeling Atari does
5. There is no emulator to emulate Falcon
6. I dont see much point runing stuff desgined for 8mhz at 1ghz
7. I LOVE to use my Atari's and fact thay are different
8. I dont have a problem if my machine took a bit more time for some
operation.
9. I dont have a problem to pay more for rare special things
10. Steem, Pacifist, WinSTon or any of the other countless
ST-emulator on a fast PC costing less than the CT60 im waiting
for is NOT an Atari... Is simple as that

Simple question for u:

Why i have to defend myself and apologize just cause i like real
machines, even with some drawbacks? I own ZX machines, CMD machines,
Acorns, etc, and not their emulators... and i never regreted cause i cant
run ZX at 100mhz.

> Do you use MiNT? MiNT-Net? pppd? Could you possible be called an "Atari

Yes! Remeber Spectre GCR.. It had a lot more to emulate as Hades would
need to, and it ran at aprox 98% of Mac Plus speed... But 060 isnt new,
doesnt have Ghz's, etc so it just can not do anything ;) (prolly cant do
with crappy apps like those on PC)

Here's a question for you:

What's the difference between running ported Unix apps like Pine and ported Unix (Linux) apps like Netscape? They're still running on "genuine Atari hardware" are they not? With a genuine Atari OS, and a genuine Atari feel?

>

I don't agree with that. Problem with that kind of emulation is, that host
CPU not only has to be fast
enough, but it has to be fast JUST enough to do needed things just the right
time.

Besides that, host system usually has different I/O and memory environment, so CPU has to "create" landscape of the target.
It is practically impossible to get 100% compatibility here, only question is, where the compromise will be drawn.

For the applications where crystall clear timing is crucial, I don't see how machines like 060 can be effectively utilized without some special hardware. With 060 (and PPC, ix86), program timing may depend on many other things, not counting the code itself. Stuff, like presence of the code in the cache, housekeeping programs interrupting the emulation, MMU table cache etc...

To cool down creative spirits, I suggest for them to try some comparatively simple exercise. Forget on the high flying stuff for a moment and take something as stupid and simple as PIC16F84.
18 pins, 20 MHz, 5 MIPS, predictable timings, simple instructions. Use 2 x 4 pins for two COMports (each has Rx, Tx, and two hanshaking lines-RTS and CTS).

Make a bridge (stuff that comes through COM1 goes via COM2 and vice versa) but use different and non related baud rates for both COMs (like 9600 bps for COM1 and 8357 bps for COM2). Make communication full duplex without the PIC forcing correspondents to stop communicating, "to take a breath". PIC of course doesn't have an UART and there lies whole point of the exercise/ make things happen when they should....
Maybe then you will see a glimmer of whole problem with emulation stuff bussiness.

Regards,

Branko

The entire point of "copy protection" is to create a disk which can
NOT be copied "exactly".

An "image" copy does indeed read out all the data from the sectors and
store it in a file to be written back to a destination disk later.

But copy protection almost always relies on things which fall OUTSIDE
of the "normal" data reading and writing methods.

Simply copying the data to a new disk without ALSO recreating whatever
arcane sector layout, or formatting tricks, or "damaged" sectors, will
leave you with a perfect copy of the data which WILL NOT run.

ANY copy program which relies on "normal" disk reading methods will
fail to make an EXACT copy of a protected disk.

For example, early protection methods simply used a special disk drive
which could write sectors with header numbers greater than the normal
range.

When a copy program tried to read the sector, either it would fail to
read it, or when it copied the sector to the destination disk, the
"normal" disk drive being used would simply write the "normal" sector
number in the header. BANG, the protection routines in the software
would know the disk had been copied.

Other methods include writing "weak" sectors which will NOT read reliably every time they're accessed. The copy protection routines will re-read the sector a specified number of times, and it HAS to return a read error at least a certain minimum number of times, or the program will KNOW it has been copied. (When you copy the disk on a "normal" disk drive, it will write the sector at "normal" strength, thus it will read properly EVERY time, and return NO errors.)

Duplicate sector numbers are another way. A sector with the actual data will be written to a track FIRST, then another sector with "dummy" information will be written to the track, with the SAME sector number. When you copy the disk on a "normal" drive, the second sector will overwrite the first one, scrambling the program.

Sectors may be written with variable timing between them, and a timing routine in the copy protection will time how long it takes to read two sectors in sequence. Since a "normal" disk drive CAN NOT write sectors with variable space between them, the program will know if it's on the original disk or on a copy.

Some of these methods CAN be defeated with well-written software, but most of them can NOT be copied with software alone.

The "Happy" board, the "Archiver" chip (for the 8-bit Ataris), and the "Discovery" cartridge (for the ST) are all HARDWARE modifications which will allow a disk drive to re-create the oddities of the format on the original disk.

The "Blitz" cable mentioned in another reply actually does what you think an image copy should do, but it does it with HARDWARE.

Blitz actually reads the bits from the surface of the original disk and writes them to the surface of the destination disk without regard for formatting, sector headers, timing, sync bits, or anything. It simply "Xeroxes" whatever is on the first disk onto the second disk.

Blitz works, but not very well or reliably. There are issues relating to the relative timing between the drives, and the condition of the surface of the destination disks. You may have to make the copy several times before you get a disk that will run, and you might have to try different destination disks to get one that works.

Also, Blitz requires two EXTERNAL drives, and requires you to solder together the cable itself.

But again, it does work, and does NOT require modifications to the drives.

There are a few books available that give more info about copy protection methods- The Abacus book on the ST disk drives gives some hints, and there was a good one on ST Protection Techniques by George Morrow. Unfortunately I sold my copy of the latter some time ago, but they may still pop up from time to time.

Check eBay's "Vintage Computers" section. STs of all flavors turn up
there on a regular basis, and often sell for pennies on the dollar.

>It's a minimum.

I don't think this would work very well in reality. Where I work we have
several "Alpha" (i.e. AXP processor) CAD workstations running Windows NT
(an very unfortunate decision of one of the managers- to use NT instead of
VMS or Unix). There is a utility which converts i86 code to AXP code, used
to convert applications to the new CPU. I think it is not set to run all
the time, but is activated manually when the machine is not busy...
Well, the results of such automatic translation are quite poor.
Some of the translated applications behave strangely, and most are
unbearably slow. Once I had to use (no other machine was available)
a translated MS Word to process a 50-pages document with a lot of
pictures included ... I do not want to repeat that nightmare.
Shortly, I do not think that much would be gained relative to
that 10X ratio mentioned.

(btw. some of our local applications, compiled from source code to run
on AXP+VMS outperform the same applications compiled for PC+Windows
by almost an order of magnitude).

>A decent emulator not exist on PC,

But that is not because it is physically impossible, only because
noone coded it. Taken together, features of existing emulators make
a quite complete list- only they do not exist together in one product.

>no 68020

In fact, commercial Gemulator is supposed to do 68020, isnt't it?

>no FPU.

which is a shame, as it would not be too difficult to implement, I think.

>bout Milans, Hades's, Emulators and try to make us who just simply likethe
>machine as it is, even with faults, dummy? Im not against new stuff, but
>they should be special and different..

Which all makes sense, to a degree... but there is another angle.
For example, I am used to applications on this platform, I don't have
to think much when I use them to do some work, it just goes naturally.
I like GEM's user interface. Actually I prefr some GEM applications
to Windows ones. I have accumulated an amount of applications and
documentation over the years. I do not look forward to chaniging the
platform and starting all over again. And my needs, computerwise, are not
much much greater now than they were several years ago, and probably won't
become greater in the next few years.

Yet, occasionaly I feel the lack of raw power in this computer. Some
program does exactly what I want the way I want, but it takes tooooo long.
So there is a need for speed and memory, without changing the platform.

Now, what can a mortal soul do? Some new, powerful, Atari-identical machine
would be nice indeed, but in the cruel economic realities, this is EXTREMELY
UNLIKELY ever to materialize. On the other hand, a software-based improvement
(called emulation if you like) is something that a single person or a
small team can realize in a short time (say- one year). So one might
take off-the shelf cheap hardware components, configure them and install
the emulation base for a TOS-compatible OS. I would prefer that to be
a PPC box, but as the Mac-clone manufacturers have become extinct,
it seems that not many such boxes are around for a reasonable price.
Therefore it would have to be a standard ix86 board. By a selection of few
well-chosen and explicitely supported components- for example some specific

brand(s) of graphic or sound adaptors, and maybe even by packing into some fancy stylish box :) a very personalized and "different" machine might be created, for a reasonable cost.

I have a text which says that Amiga had a very good control over
floppy disk drive, as it did not have a disk-controller and CPU personally
did all the work, so it had access to anything written on the disk,
bit by bit: sector headers, syncs etc. The text said that physically Amiga
might copy almost anything that was written on a floppy. If those statements
are true than maybe someone who is desperate to copy a protected disk may
try that route, if an appropriate copying utility exists.

Some extracts from the text follow:

>>Is it possible to bypass the MFM controller that the Atari uses so that

I'm almost ashamed to admit it, but the last 15 months I've been
developing applications in MS Word, and it's development system is many
times better than anything you can get for TOS. Even though VBA isn't that
great, the editor is very good, it has a very good debugger, creating and
handling dialogs is dead simple and very powerful. I guess that many here
has MS Word on their PC (either at home or work), try pressing Alt+F11
while editing a document some time and see what happens. Word might be a
shitty word processor, but you can do quite amazing things with it.

If you have an early ST, you will need 2 external drives asx it doesn't
have an internal one.

yep Early versions of the blitz software came with instructions on how
to build the cable, there was also another copy program that used the
same cable.

Power computing also distributed the blitz turbo copier, which is based
on the same cable. They also produced an external floppy with it built
in.

The cable plugged into the external drive port AND the parallel port of
the computer.

There are lots of disk the blitz wont do. It's not a case of the disk,
it's more the protection used.

Also the blitz is NOT reliable, even on NON protected disks (the
standard formatted ones).

I am in a position to have tried the blitz, blitz turbo, syncro express
and happy discovery hardware.

If you want to learn about using the fdc directly, then the abacus ook mentioned above is a good place to start. It doesn't have all the answers, BUT you can reread later when things start making sense.

It also includes a disk monitor in asm for you to type out. And it isn't bad at all. It took me ages when i first got my copy. And i don't intend doing it again, even though i lost my listing and compilation.

I do have a copy of the book for sale if anyone is interested.

>

I managed to track down Sheldon Winick via the net. I knew he had a TT and SLM working as he is also an architect.

He forwared me his files direct from his TT. I had guessed right, his files were newer than my original disks by about 2 years. Nothing from the older disks worked. It has printed one file now, so it will probably print others. <G>

So, does anyone have the complete set of disks for an SLM installation with files dates of 1990 or newer?

Thanks.

Ken Springer

Protocols that work with NAT will run on the NAT'ed computers just as if
they have a global IP address. No need to change configurations.

If using proxies you will need a separate proxy server for each protocol
you want to use on local computers and also set them up to talk to the
proxy instead of the real destination.

I had this TT with me last weekend to Nordic Atari Show in Malmï¿½ and I
only had to change one setting in STinG to work as normal: DNS server IP
address and the reason for that was that I actually use the built in DNS
proxy in my router on 192.168.0.1 because the router gets its addresses
via DHCP from my provider.

I have since long setup my TT address to 192.168.0.129 to be able to keep
this setting even when others are on the same subnet :-)

>WINGATE just talks to IP interfaces. Provided you can make the connection
>using either
>the Direct Cable connection "modem" or similar it will proxy. I use it often

"Direct Cable" in the Windows usually don't use TCP/IP. At least in Win95
you must fake a dialup connection. I seem to recall that newer Windows
versions actually has some support for nullmodem, but mine has not.

While checking out the Wingate issue I found this link that talks about
Amiga-Win TCP/IP using Wingate and proxies:

http://www.amiga.mcmail.com/null-modem/null.html

Might be interesting reading for those who wants TCP/IP Win<->Atari too.
It seems to basically use similar solutions like I used before I bought
the Netgear RT314 NAT-box.

>I would have thought that you could use the NAT built into WIN2K without
>problem,
>but the trouble with this sort of solution is that because MS hides so much
>under the GUI

>it can be hard to configure and debug when you are not using it in exactly
>the way MS suggests.

As MS never thought of any reason to run TCP/IP over serial cables this
would indeed be very hard. Most MS solutions are really unfinished hacks
that fails as soon as you don't use them exactly the way they're supposed
to.

>> I have only read the Wingate doc's without installing it. I like to keep
>> my pc clean without the need to reinstall etc...
>
>The uninstall is very clean.

I have heard some horror stories about that, but maybe there computers
were instable to begin with? Anyway NAT32 does not come with any
installation program so maybe that's the reason I like it...

>on the original disk.

The 'Happy board' for the 8-bits is a modification as it is fitted
inside the disk drive, the Happy 'discovery' cartridge doesn't. It sits
in the cartridge port and uses a simple extension type lead to control
the internal disk drive. and so it can't be a hardware modification.

A modification to me is something that is done inside the unit, to add
something that isn't normally there: serial port modification -
increases the baud rate by adding, high density modification - to allow
use of a hd floppy.

I don't see a cartridge as a modification!

Hi everyone,

As a related aside to this thread, yesterday i was in a game shop, i think it was either Electronic Boutique or Game, anyway, some items i spotted on their shelf was a Spectrum emulator for the PC with about 5000 games and also a Amiga emulator for the PC with a thousand or so games. I couldnt find an Atari emulator though!!.

>might copy almost anything that was written on a floppy. If those statements
>are true than maybe someone who is desperate to copy a protected disk may
>try that route, if an appropriate copying utility exists.

The Amiga can't always copy it's own disks, and the data on Amiga disks
isn't that secure. At a bit level you can store around 7.5k per track,
which means that an 11 sector (using 512bytes) will be pushing it for
data security.

>
>Some extracts from the text follow:
>
>>>Is it possible to bypass the MFM controller that the Atari uses so that
>>>it reads what is really there, not what it thinks is there? Is it
>>>possible to access an Atari formatted disk at the individual bit level?

Yep the atari can write and read 11 sector per track disks, but you have
to have good quality of media. And they also go bad 90% of the time. I
think the computer software compilation company Beau Jolly learnt that!

>
>>That is not possible because the Floppy serial data in and out lines are
>>connected to the WD1772 MFM controller.

It isn't!!! That's news to me!

But you can read the entire track with sync and data, which is 100%
correctish, you then shift it around a little as the bit stream is n
bits and all computers deal in bytes for storage.

>
>>>Why did Atari use an MFM controller when the Amiga doesn't, surely if

>>other hand in the Atari the MFM controller did everything in DMA (direct

>>memory access) mode.

The Amiga disk structure, iirc, was based on the same architecture and
developers that Atari used for the 8-bits. So i wouldn't say cooked
their own soups.

>

>>copy protection can check also for the length of the gaps BETWEEN the
>>sectors, the MFM CRC (checksum), wrong header, what all is NOT saved in the
>>*.ST and *.MSA files. See the following things:

Hmm.. me thinks this is an Amiga user based on amiga thinking and not
much knowledge of the Atari!

The blitz lead wasn't the first on the market.

Now we head into contradiction time. It's already been stated that you
can't access that info, according to the other bits, then how the hell
can the copy protection software do something that isn't possible then?

Files images like .ST came out with the introduction of emulators, and
.msa were designed to store the data the best they can KEEPING the file
length as short as possible. They weren't designed to copy protected
disks.

>
>>Lets write the byte A1h to a diskette and let's see what's happen on
>>different systems with that.

We already know the amiga uses a different file/disk structure. So one
fdc index or command on one system isn't going to be the same on the
other!!!!

OK

>
>>ST/PC uses MFM to write a bit to a magnetic media:

The amiga doesn't use magnetic media!!!

>
>[...]
>
>>The Amiga does the following in GCR coding, (the MAC does similar on DD

>>and all this GCR coding/decoding is done by the 68000 CPU which is very busy
>>while reading and writing... That is also the reason that Amiga/MAC/C64
>>diskettes can not be read on a ST or PC. But as the 68000 is doing the GCR
>>coding/decoding, by using another software it is also capable to code/decode
>>MFM.

Yes it's a different system. So maybe thats why the Amiga runs slower
that the Atari/pc while accessing the disk, and gives that annoying
click from the drives!

>
>>[...]
>
>>Now let us play copy protecting...

This is going to be fun:)

>
>>- I change the CRC, the result is a read error...

Yep, you can do that on the ST

>>- I change the sector header, the result is a confused floppy controller or
>>copy program, protected software can check that and read that sector with
>>some tricks!

Yep, can be done with a basic sector editor.

>>- I change the length of the gap... (That is possible! 10 and 11 sector
>>formats are using smaller gaps to have more place for the additional sectors
>>in a track!!!) Then I can measure the length of the gap.

But on the Atari, you have already said this is impossible so the
protection wouldn't work on that format!

>>- I forget one sector and have a looooong gap..., or I forget more than one
>>sector...

Yes this is possible on the Atari, not very hard!

>>- I use the gaps to store some essential informations, the copy program will
>>not copy and my copy protected program hangs up when it is not finding the
>>data in the gap...hehehe...

Yes, that's dead easy. In fact you can use the entire track on the ST
disk to hold the an entire track of data if you don't need a file
system.

Backlash is a prime example of this......

>>- I use different sector sizes....

Yep, the atari can cater for several different sector sizes AND you coul
deven create your own file system if yoiu needed.

>>- I do all that on track 81,82,83, and then the protected software checks
>>these hidden tracks...

Track 81 - 83 = hidden tracks..... Now lets be real for a second.

Not ALL disk drives were designed to go above 82 tracks, some were
designed to go above that. But what company would produce a protection
system that relied on extended formatted track that will go outside 99%
of the disk drives available.

Or where all amiga's produced using there own disk drive chasis!!!

You can access these tracks on atari, they aren't hidden.

>>- The WD 1772 recognizes different bytes as adress mark, but it used only
>>one special as standard. I write one of the others, and the copy program
>>will not recognize but my copy protected software does...

So it hasn't a 'hidden address' mark command! mmmmm

>>- I modify the boot sector, I put the information in that the disk has only
>>7 sectors and 78 tracks... the copyprogramm, also MSA and makedisk will use
>>this information and they will not read sectors 8 and 9, and not track 79
>>and 80...

And so will fastcopy, also viru' can alter the boot sector data to give
false readings. But we are suppose to be talking protections that the ST
can't do.

Tracks and sectors that are NOT catered for in the bpb, CAN be copied
using BASIC disk copiers; the ones designed not to copy protected disks.
There is nothing special about the secotr they are just not specified in
the boot sector of the disk.

>
>>Until here a very good copy software can copy, but MSA and Makedisk already
>>not... So let us improve:

I thought the magic shadow archiver also allowed you to specify you own
disk config OR use the disk info!!!!

<---- snippity snip all the codes etc. ---->

>
>>That all only can be copyed with an Amiga, or maybe with that BLITZ TURBO.
>>But the most "proffessional" crackers at the time had an Amiga...
>
>
>cu

Now this is my problem.

We all know that the pc and st use the same fdc processor, or a descendant, so the disk structure for other machines aren't the same.

There are also other formats for archiving disks, why is the .st and msa commonly used. They weren't the earliest.

And references the blitz cable, this wasn't the earliest. IIRC the cable before it was named blitz was called the Knuts or knutz!! But yet again it wasn't the earliest!!

You can access the fdc directly from within the st, therefore you can also create your own custom disk format. Which means you have to do some thinking unlike using gemdos to image the track it's going to format for you.

Does it boot into TOS fine and work on this OS? Which version of Magic do
you use? Try renaming magx.inf to magx.cfg then when presented with file
selector load up magxdesk.app which is your chosen desktop right?

The Phantom has problems in some places, can't print with NVDI in turbo
and under hard work (mainly audio DMA/DSP work) the machine will freeze
with audio looping and nothing responding on screen. Switching off turbo
overcomes this problem. I'll be modifying mine to somewhere about 40Mhz
to be safer on chips and actually work on my Falcon. 50mhz is just a
little to far me thinks.

Which version?
For version 1.1.0 and 1.2 you can find English rsc on the Belgian
ftp-server:

ftp://chapelie.rma.ac.be//mint/gem/aes/n_aes/

The latest N_AES is delivered with German/English rsc.

But it isn't documented anywhere (atleast not in English!) that you have
to set "language=1" in n_aes.cnf to switch to English ;-) And this only
applies to the AES, there's no English RSC for N.Thing. You'll need to
switch to Thing (and register) for that.

Yup, you can drive yourself nuts trying to replicate a copy protected disc.
If you are locked out of a favourite bit of software your only guaranteed
solution is to disassemble the object code and track down the protection
algorithm which can usually be short-circuited with a patch of a few bytes.

This is a helluva job so you really have to WANT to regain access. The large
variety of protection algorithms means that any other method is unreliable
to say the least!

909. WTB: ST or TT RAM for TT030

Newsgroup: comp.sys.atari.st
Date: 2001-06-23 19:28:28 UTC
From: Martin-Éric Racine <q-funk@funkyware.atari.org>
Message-ID: <Pine.LNX.4.21.0106232222360.6085-100000@hal.pp.fishpool.fi>
Source record: 44678

I have a spare TT030 with only the basic 2mb of RAM, so I need
either one of the following:

* Atari 8mb ST RAM card
* Atari 16mb TT RAM card
* 3rd-party TT RAM card

Reply to the usual address on pp.fishpool.fi to avoid the above
publicity deflector, if you have any memory daughterboard along
these lines for sale.

Thanks!

I like that idea as long as the emulation is fast enough and good
enough to perform well.

Indeed. One of my friends is a professional printer who still use
Calamus as main DTP program. As professional he uses some other DTP
programs too like QuarkXpress and Indesign. According to him nothing can
beat Calamus.
BTW: Have you tried the latest Lynx? It supports ssl now.

MiNT is as easy to set up as MagiC. In fact I had more problems to get MagiCMac running on my G3 then I ever have had with MiNT on the Hades. The big difficulty is setup MiNT-net which is indeed rather hard to get it running. MiNT-net is however not required in order to work with MiNT. If one is happy with STing/STik one can use Sting/STik. One can even use Draconis and Wensuite.

Anyway right now MiNT is maybe not a real solution for some users but in the future it will probably be the only real OS for our platform. Magic has no future anymore.

Yup. but it's fun getting there:)

If you can remove the protection BUT leave the code INTACT, as if it
passed the tests, was my preferred method. You never know if any part of
the code is used later in the software.

This is going to spawn a whole new thread, i can feel it in my isp:P

When i use to back software up many moons ago, especially when i did the
mockingbird menu routines on the 8-bits, i always said if you can get
the computer to read it you can write!

>
>Isn't copying a disk just reading it, then writing back the same data?
>How can my protected disk for example choke on a particular track or two
>(obviously where the protection lies) and fail to copy (at least with a
>normal copier), but still be read successfully using the same disk
>drive, same computer etc.?
>

Trying to think of something to compare it against aint easy.

you could consider the disk as a 2 stage writing process.

1) theres the formatting, like the foundation of a house, without this
the file structure has no structure.

2) the file data.

when a program is read or copied the program file itself is read, but
NOT the disk structure.

You need to read the disk structure and rewrite it to be precise. It's
not the bits in the data field that's of interested, it's the bits
between sectors OR in the address fields.

for example: There are bytes called control bytes, these allow writing
of crc's etc, and they are 2 bytes codes that write ONLY 1 byte in the
track format!!!

I hope this helps, cause it is a large subject.

CAB is not fast. Everyone who uses it knows this, but it is still the
most stable Atari browser. Text only mode helps, but makes some
webpages completely useless.
Have you tried the 2.8 demo version, or thought of buying the
commercial version? Even the demo version is much better than 1.5.
1.5 does not support frames. In the demo version the hotlist is
disabled, use 1.5 to manage your hotlist, use STinG/STiK and Dan
Ackerman's OVL and you can use the 2.8 demo perfectly!

Version 2.8 is a little bit faster, but still very slow.

>Does it boot into TOS fine and work on this OS?

If you mean does my Falcon (TOS 4.04) boot ok with the new clock patch,
the answer is yes. Everything works as did before (my normal boot set-up,
programs, etc.).

>Which version of Magic do you use?

I don't :) Never liked loosing my Falcon desktop/keyboard features!
But for this thread, Magic 5 and 6 loaded and re-booted this Falcon MKI
fine when they were purchased! They both load now from their original disks
with no problems until after the re-boot and then "fatal gemdos error..
system halted"! I then have to shut the hard drive off to get it to boot
from the floppy because holding down the ALT key won't do it (it usually
does in other cases).

>Try renaming magx.inf to magx.cfg then when presented with file
>selector load up magxdesk.app which is your chosen desktop right?

Will try it!

Only the new Clock Patch is installed here! I'm still at 32mhz and
have'nt installed the CD Clock yet either.

for a very long time. Can anyone help? Is this normal, or
> are there some settings I can change? I am using it text only.
>
There's nothing wrong with CAB. The STE is just a very slow computer to
browse the web. Pages containing tables may also take longer to display
because the browser has to "calculate" the complete page before displaying
it.
Later versions of CAB are a bit more quickly but don't expect wonders - you
are browsing the net with a computer that is basically 16 years old.

Greetings,
Matthias

>DC>it "Couldn't load driver file"! What's going on here?
>I suppose you can't modify a recent driver file (HDDRIVER.SYS) with an
>'old' configuration tool (HDDRUTIL).
You can't, as you get the "Wrong driver version" alert, and that's the end of
that.

This is a really wierd problem, it's only 7.71 and 7.80 that exhibit this
problem of not being able to load the driver file...

>>>Disable the TSL line in magx.inf and check for conflicting auto folder

>> Don't see a TSL line? and I'm Booting vanilla with Magic!
>
>Right that's OK then.

No, it's not. Pre-emptive multitasking at the time the inf file is read is
the default setting. You must ADD the line ;TSL in order to turn this setting
off.

>The Phantom has problems in some places, can't print with NVDI in turbo

Try the IPRN driver, the demo of which is in the NVDITOOLS folder of NVDI.

It seems to be down to ones' mind-set. If you just want an install with a
couple of mouseclicks then MagiC is the way to go. I'm afraid that I fall
firmly in that camp!

>The big difficulty is setup MiNT-net which is indeed rather hard to get
>it running. MiNT-net is however not required in order to work with MiNT.

I grabbed the "MiNT-net for dummies" distribution, but it's still sitting on
my hard drive! I suspect that that's where it'll stay, as I don't really have
a use for it.

I suspect that you're right about the future of MagiC, on the Atari at least.

> clumsy half compatible GEM. Note, apps prolly wont be developed exactly
> for CF or PPC...

People go on about apps not being made for the CF or PPC and that is why we have to stick with 68K code (i.e. CF or PPC with emulation).

This is rubbish, how many "GEM" apps (I say that loosely) are out there which have been re-compiled for different CPUs, many would say "none"..... but think again, many apps have different code for all the different CPUs such as 68K, 030, 040, 060. If we put CF on the end would it be much harder for the programmers? Few apps are written in Assembly these days, Basic, C, etc apps can be re-built with the CF instructions.

I used to do the same thing on my STE, CAB 1.5. It really is slow and
there is no way to change that except for :-

1) Get a big accelerator in your machine.
or
2) Get CAB 2.8 which is a lot faster, believe me.

Well if you have a lot of cash floating around get both :)

CAB 2.8 also supposrts frames and can format a table faster, a page like
Yaho really did slow down an STE with CAB 1.5, I would imagine CAB 2.8
would help.

The way you are talking one would think that the ST range of computers started (and ended) with the Falcon.

We would all like a new TOS machine with an 68090 at 300Mhz in it but it is not going to happen, the upgrade paths have been presented to us. We still have problems with speed - internet is a big part of what I do and I can't do it on an Atari as much as I would like to it is not going to happen on an 030 CPU.

Atari realised the ST was not good enough for some jobs so they brought out LOTS of new ones, Atari went under, but if they didn't do you really think they would have stopped at the Falcon saying "no one would want more than this, the apps that it runs are fine".

I have never used them but do you think that papillon and photoline would run nicely on a 512 ST? So you use a faster machine..... the point I am trying to make is that better applications *can* be made if we have better machines.

what's even more pathetic - not only does The iDiot Forever Known As
Sinclap claims that it is a college graduate - which, if this is an
example of what American colleges put out, then the USA is doomed - but
also claims to be an "Apple Power Rep", which is highly unlikely due to
the fact that real "Apple Power Reps" (yes, I have spoken to real ones
at Macworld Expo NY) require a high level of reading and writing
comprehension as a term of employment. TiFKAS is still refusing to
divulge who employs it (muttering twaddle about "Atari Jihads" who are
"out to get it").

> time someone criticizes you.

years ago TiFKAS would defend its constant attacking of Atari users
in c.s.a.st (which was in violation of the newsgroup charter, which
forbid "computer vs. computer" debates) by wrapping itself in the
American flag and claiming that it was protected under the First
Amendment of the US Constitution, which promises freedom of speech.
When, however, I discovered that the US Supreme Court had ruled in 1974
(in the landmark case "FCC Vs. Pacifica" AKA "Pacifica Broadcasting's
playing George Carlin's Seven Words You Must Never Say On Television")
that public nuisances were not protected under the 1st Amendment and
could indeed be subject to criminal and libel prosecution, and made that
clear in that forum that TiFKAS defined "public nuisance" to a T,
TiFKAS promptly shut up.

I find it interesting that TiFKAS is accusing you of being from
Canada, Hallvard (notice the "up North" reference) -its known emnity to
the Great White North is showing, due to the fact that a number of its
most vocal critics who have totally humiliated it in exposing its vast
ignorance of anything computer-related hail from there, often claiming
we have a lousy "socialist government", are sinking economically, and
are nothing more than "US-owned territory". It must really hurt it to
discover that currently Canadian economic growth is larger than the US,
not to mention that at least in our elections we can count, unlike in
TiFKAS' US where they allowed the dumbest politician since Dan Quayle to
become president due to a stupid concept like the Electoral College.
(It's also funny that the newspaper it uses as "evidence" of the bad
stuff about Canada, The National Post, is also considered a national
joke which has bled red ink since its inception, and that its publisher,
Conrad "Tubby" Black, has fled Canada with his tail between his legs out
of shame).

> >> If you think you're bringing "Mac-evangelism" to the world you've

>
> Again, I see no need to comment on this as your postings speak for
> themselves.

ROTFLMAO! well said, Hallvard!

TiFKAS is now denying that it is a "Mac Evangelist"? After all these
years of carpet-bombing c.s.a.st and .advocacy with its obvious pro-Mac
drivel? After calling users of fuji-badged computers "Atari boobs" who
"need to get laid"? After saying such things like "Calamus is crap", and

"90% of all Atari applications fall over on the Milan"? Who once claimed
that Apple, depite a BILLION DOLLAR LOSS in 1997, still showed a profit?
>
>
> >sinclap!
> >somewere in mpls
>
> Still too scared to reveal who you really are...
> Can't stand behind your worthless drivel, can you?

its name: Peter Sinclair (sometimes Peter Sinclair-Day)
its ISP - Earthlink (check the headers, that's where it's posting
from)

> Makes me wonder how many Internet providers you've been banned from....
> I'm sure this isn't the only newsgroup you've been polluting with your
> endless stream of crap.

TiFKAS has also been known to spread its reign of error in the amiga
groups, as well as the Lynx and Jaguar groups.

TiFKAS has also been reprimanded by Cedarnet.org for violating its
user agreement when it was active in attacking users in c.s.a.st (a
charge it denies, despite the fact that I was e-mailed by Cedarnet and
was told that it had been warned and reprimanded, subsequently TiFKAS
disappeared from c.s.a.st for a time like a whipped puppy), was tossed
off DejaNews for a time for posting sexually explicit content in
.advocacy, and was banned from Hotmail after it used the service to send
harrassing e-mail to one of its critics.

People like this always hide behind some fake name.
He probably won't ever give his real name or exact location.
This allows such morons to speak in such a manner and never
really be held accountable. In fact nothing he's ever said
can be taken serious, probably all lies since he lies about
his name.

If by some miracle that is even true at all then it might explain
the fake name. If my work place seen me conduct myself in this
manner they would not be happy at all. Of all the MAC users I
ever met, they are quite the opposite of sinflap...

Well you can insert whatever word you want if you wish to keep
beating this topic to death. He obviously meant "faster"
when he said "better" machines. You think some newer raytracer
would be ported to Atari? Nope. It's not cause the machine is bad,
but lacks enough speed to make such a project worth while. Speed
can be a serious issue and it plays a factor in what gets released
for our platform. At some point one has to bend, something has to
give or we can all be happy fussing with a mixture of half assed
GEM apps/unix apps trying to do some simple task the rest of the world
takes for granted. If you don't like the emu idea, or ppc idea
don't buy it, keep your falcon next to you. That's how you solve that.

Frankly I'm tired of CAB, it messes up I try lynx. Lynx fails
I try w3m... this is not how it should be. It's frustrating and
if I have to run to my freinds house to do some work on the
web something is very wrong with this picture. It seems to come
back to speed... no speed no usable browser...

Am I alone in this frustration? I think not. ;-)

Amen! And IMO that would not have to interfere with the atari feel. Ppl might object here, but to me it is the OS and its parts that is the great thing about the atari. The hardware is the stuff supplying the power, but the neat stuff is in the software above all. And I think you put it nicely, "better applications *can* be made if we have better machines". I'll second that. Not saying there is no good software at present time, but it would open up new possibilities.

Well from using Lattice C the hard work is doen in the compiler and all
you have to do is select the processor. I'm not sure but I don't think
there is a PPC compiler for the Atari, maybe GCC?

Hi,

I Use FlashII (text only), and as mentioned, some sites are totally
useless.
I would like to try CAB 2.x demo
But when I go to the following site,
my system says: 14meg read out of 16meg. (Something like that)
I freeze up at this site, and cursor will not move around to
highlight links. What's wrong?

The site is:
user/tninet.se/~gcc561r/english/

Very interesting site, by the way.

Where exactly did i say that? What i did said is that Atairs introduced
something new and different to computer world, ST did have great hardware
design at its time, MIDI... later Falcon introduced DSP which can be
programable to mass users, sound matrix etc.. or Jaguar, or Lynx.. Now how
can PC board or Mac board with emulator compete with that? Or deserve a
name "new atari"?

> We would all like a new TOS machine with an 68090 at 300Mhz in it but it is
> not going to happen, the upgrade paths have been presented to us. We still
> have problems with speed - internet is a big part of what I do and I can't

> 030 CPU.

I guess nobody told that to SCT1 guys... While all present Atari
comunity cried how mp music aint possible, how cool would be to have PPC
bla bla, they did mp3 player! Same for Nocrew guys and their mp2 player. I
have 030 machine and i dont have any speed problems. Im easy person, i
dont need all to be done in miliseconds, i CAN wait few secs for page to
load.

About internet problems: partialy i agree, but please dont mention
Netscape again.. It is slow, big, bad piece of code.. Put it on ST or
Falcon or TT, load super simple text only page, without any goodies like
flash, java etc and measure time, CAB is F1 car compred to it! Do u really
wanna such app? And: i dont care about CPU too much, but as i said, i wana
genuine machine, not a emulator! If u remeber Phenix project u can see
that today good, genuine and diferent projects CAN be done.

> I have never used them but do you think that papillon and photoline would
> run nicely on a 512 ST? So you use a faster machine..... the point I am
> trying to make is that better applications *can* be made if we have better
> machines.

Sure they can be! Tell me one? Ill mention Mp3 player again, and as we
speak New Beat makes ACE softsynth, which was tested by music comunity and
results are not bad, a year or so back DHS came out... Or Vision, which
looks a bit odd, but filtering etc vis DSP is fast. All those guys dont
admit, or u didnt tell them, that 030 is bad. And dont think Papilon for
example is good.. A lot better can be done on 030, infact i think Papilon
was done on MAC. That would explain why it slow and slugish on my machine
and only thing where it is fast is crashing.

So u re right apps can be made, but it seems ppl who LOVE their machines, not dream about some high end stuff does them atm. Can u tell me one company which did app which can use great Milan/Hades gfx capabilities? Or CAD prg or Renderer etc which use 060 speed? Or simply any piece of code to realy use those capabilities? And if few ppl now buy new machine developers and company will just pop out?

I see u dislike Falcon, but thanks to guys who love it as it is, and seek posibilites WITHIN the machine i have bunch of apps that cant run on Hades/Milan, which are better as those on Hades/Milan, some are even faster.. I agree i have speeder, but im still on 030 for which u say "its not going to happen".. It did happen and still does! And if i will one day really need soe humongous RAW cpu power for apps like Netscape, Autocad etc, ill get myself PC/MAC.. i wont try to rape Atari with those, not too mention that anyone who use such apps profesionaly also want support and fast upgrades, some 3rd habd modules, libs etc.. which are only provided on those machines..

You could turn a CT60 or Tempest into a complete, standalone computer,
just add a PCI-bridge to them. Add a graphics-card, a SCSI/IDE card, an
ethernet-card and soundcard, and all you need is a small host-card to
replace the functionality of the Falcon (mouse/keyboard and a boot-ROM).

The problem here is that in addition to develop the hardware, which can be
hard enough, the OS must be adapted and drivers must be made. By using
existing hardware one could eliminate a huge part of the work. Also,
developing and producing hardware is very, very expensive, software can be
developed at little cost and risk.

In fact, almost everything we need is available for free as we speak. We
have a free kernel (FreeMiNT), a free VDI (fVDI) with a free driver for
ATI Rage PCI-cards, a free AES (XaAES) that works under FreeMiNT, a free
driver for Soundblaster PCI-cards (GSXB with ES-driver) etc. What's
missing is a free 030-emulator, a PCIBIOS and harddisk-driver for a
current PC or PPC motherboard and some changes to FreeMiNT to let it boot
on this hardware.

I have Power Computing's Ultimate Diascovery cartridge which I
think may also be able to do that. Had it for years but never used
it!

>The "Blitz" cable mentioned in another reply actually does what you
>think an image copy should do, but it does it with HARDWARE.

I think I have one of those too somewhere, but again never used
it with my STFM - the Falcon doesn't have a second floppy drive,
of coursde, though I suppose a socket for it could be fitted.

>There are a few books available that give more info about copy

The external drive is a DMA device, no SCSI ports. It's got and ICD
host adapter.

As you probably read by now, newer software has solved the problem. But
I have just minimal files, I believe. I'd like to find the complete
set. <G>

I agree. Machine specific compatibility would also increase the price.

> Situation would feel much better if there was an alternative to get a
> new PPC (or even CF if PPC is out of the question) based board that
> could offer decent CPU-power.

I don't know if you know about the bPlan board (http://www.bplan-gmbh.de).
They're doing exactly that and the next AmigaOS and LinuxPPC will work on
that machine.

>Such a machine would have a lot of power

You could easily port dozens of application without spending months on
optimizations. Ported apps often don't look as fine as genuine ones so
there's a place for both ones.

> That is great, since it keeps ppl attached to their ataris, so
> all coders does make a great job on that so much respect to them. But I
> think I am not the only one that wants to use the atari for stuff other
> ppl use their pcï¿½s for.

I'm using a PC (but I still have my Falcon though). Why? Because my Falcon
was much too slow for web sites and there are some apps which just don't
exist on the Atari. It would be great to have a fast TOS clone with a new
extended TOS.

>It might not be what everybody wants, but it would at least
> bring more power. Power which I think we are in desperate need of.

Yes! And some apps could really use some more power (e.g. STemBoy).

Greetings,
Matthias

>

Heh... this worked... at first.

You'd find the Jump to Subroutine that would branch to the copy
protection check, and simply NOP out those bytes. The program
would get to that point and ignore the NOPs, and never execute the
protection routines.

Then... those bastard programmers started putting "double checks" in
their code. Later on in the game they'd check to see if the JSR
command to jump to the protection routine was still there. If it
wasn't, it meant the code had been "cracked", and they'd do something
like disable the guns on your ship. Or jump to a message that said
"Go Buy the Game".

Then.. they'd add another check to see if you left the JSR, but had
diddled with the protection routine itself.

Then... they added a complete second disk check during the game,
located who knows where in the code.

Or... they'd do a checksum of the entire game code to see if it had
been modified, independent of the disk protection.

Talk about brain numbing..!

BobR

Chapelie server, under editors and ghostscript. Pick up both fnt
packages, the lib and the binary and I think a small RSC file. AL in
that directory so I found it easy to install.

Erm not really understanding you here. Magic AFAIK has to be installed
onto the hard disk. When you say "original disks" do you mean floppy
disks or hard disks?

>copying you fail.
>
>Isn't copying a disk just reading it, then writing back the same data?

Well, obviously any "protection" on the disk MUST allow the disk to be
read reliably so the program you've bought can be run normally.

There HAVE been protection schemes which DID interfere with this, and
thus were dropped. (Same for "protection" on things like video tapes
and audio CDs.) If you can't play the original, you're never going
to buy anything else from that manufacturer.

Virtually all the protection methods used on disks rely on SPECIAL
disk drive setups that the manufactures use to create the disks they
sell. These are different from the disk drives you can buy in a
"normal" computer.

The protection relies on the fact that while your computer disk drive
can read the data, and write it back to a disk, it can NOT write it
back to the copy disk EXACTLY THE SAME WAY it was written on the
original disk.

Yes, it is the same data, and yes, the DATA can be read back from the
copy exactly as it was on the original, but there are DIFFERENCES in
the WAY it is positioned on the disk, or the way it is "described" in
the headers, which allow the software to detect that it is not on the
original disk any longer.

These special drives can write things to the original disk in ways
which are "impossible" in a normal situation. When you write a copy
on your computer, your "normal" disk drive will write it in the
"normal" way. The software can detect this, and knows it's a copy.

>How can my protected disk for example choke on a particular track or two
>(obviously where the protection lies) and fail to copy (at least with a
>normal copier), but still be read successfully using the same disk
>drive, same computer etc.?
>

In a case like this, there have been copy protection methods which
take over control of how the disk is read from the original disk when
you load it normally.

That is, then you put the disk in and execute the "program", you may
actually be executing a "loader" which is designed to load the actual
program from disk, then turn control over to the program and run it.

The loader may load tracks 1 through 18, then skip track 19, and
continue to load from 20 on through the end of the data.

Then, track 19 is either left unformatted, or may be formatted with
"impossible" sector headers which will confuse anything which tries to
read them.

When loaded "normally", everything works just fine because the loader
skips the bad track.

When you try to copy the disk however, the copy program doesn't know
anything about the special setup on the disk, so it tries to copy all
the tracks sequentially.

It will copy tracks 1-18 just fine, but when it tries to copy track
19, it will choke and hang.

This was an early copy protection method, and it can be defeated by
"intelligent" copy programs which either find and skip unreadable
tracks and sectors automatically, or which let you manually tell them
which tracks to copy and which to skip.

The problem even with doing it this way is that you really have no way
of knowing exactly what is in that "bad" track 19. Simply skipping it
may not make a runnable copy because the copy protection routines may
make a check after the main program is loaded to see if track 19 has
the PROPER errors in it.

Also, once again, if the track is intentionally left unformatted,
you're screwed, because your "normal" disk drive can NOT "skip" a
track when formatting the copy disk. The special drives the software
manufacturer uses CAN do that.

That is, the manufacturer will set up his drives to format tracks
0-18 and 19-39. leaving one track unformatted and unreadable.

When you format a disk for the copy, your "normal" disk drive will
just go ahead and format tracks 0-39 as usual. There's no way to skip
a track with a "normal" setup.

So you end up with track 19 which is blank, but which otherwise is completely normal.

All the protection routines have to do is to try reading a sector from track 19. If they can, the disk has obviously been copied.

>Hallvard

It's usually more complex than this, but this should give a good idea of how the "cat and mouse" game between the manufacturers and the pirates is played.

That is not what I said or meant. But they are getting old and outdated and so there are things they are not that well suited for, because they might be lacking raw speed.

Some may not think speed matters that much these days, so to them a new clone should not be interesting anyway.

Do you mean Power Computings Ultimate Ripper Cartridge?

This is a very useful tool, but has some bugs. It also has a few a
feature not documented. As a matter of interest I contacted power
computing not long after the cartridge had come out, asking various
questions. They didn't seem to be bothered much about it though.

They then produced a double cartridge which had the ripper and supermon
together. The ripper part of this is bugged to hell. They claimed that
this couldn't be helped and was down to the programs sharing the
eproms!! Well I programmed my eproms and had no problems getting them
working together without the bugs.

They told me, on the phone, that they weren't really interested in the
cartridge anymore and after-sales service were non-existent. The
technical dept, even said that i could play around with the carts and
data to my hearts content. They had no idea of the routines and bits the
cartridge could also do.

So.. i went through the code, byte by byte and transformed it into an
asm listing. It took weeks, and what's more it worked when recompiled.

The ring inturrupt feature of the cartridge is good for stepping through
programs. Although the hex digit a will be found under the q key. Yep
they got the key code wrong:P

>manufacturer uses CAN do that.

I beg to differ.

The drives in the Atari can format a disk a track at a time, and can
skip tracks entirely. No special drives are needed just little
programming.

By accessing the fdc yourself, you can create custom formats yourself
without ANY special disk drives or extra hardware.

All it takes is a little thought.

You can format a track, step out, step out, format the next track

track 18 - format track, step out
track 19 - step out (no formatting)
track 20 - format track, step out
track 21 - ....

When you format from the desktop, you set off routines that do just
this. You can use routines just to format a specific track, without
having to control the fdc yourself.

If you know what a track format consists of and the rules, you can
create a custom track yourself.

Going back to the miss the track protection, yes we are talking the type
used by Activision's Power Drift. It's not a new protection, in the
5.25" 8-bit days, they left large amounts of unformatted tracks because
it gave quite a bit of wear n tear on the drives and also took ages.

more modern ones aren't necessarily there for protection. Some companies
just format the disk that's being used (the tracks the program uses).
You can set fastcopy to copy only the tracks used, and not format the
others.

Hi Derryck,
Will try the ;#_TSL <non-preemptive> line.
Haven't gotten that far to use timeslice.cpx, etc. The "system halted"
message occurs on an otherwise blank screen before the desktop!
Thsnks,
John G.

There are Install.prg's on both Magic 5 and 6 original floppys which
install Magic onto the hard drive (drive C here). From there I re-boot
the system (tried soft, hard and switching the power off and on). Then
there are two boot screens: the second is after Magic re-boots. That's
where the "fatal gemdos error...system halted" message appears!

Quaderno and Hypnosis: More Atari-Midi Freeware!

Manfred Hanke has released to me the Atari ST version of his Quaderno program which is a spectacular alternate mouse program with sequencer.A composition application. He also released an algorithmic program called Hypnosis. I have created the page for it. The only drawback is..no docs. Perhaps in the nearby future. He is also looking in his archives for a 256 color version for the Falcon! Now THAT would be cool. In the meantime, please check out these very unique programs.

U need to wire pins 1 and 2 (sound and composite) and pin 13 (gnd) to TV
via SCART or to RGB monitor. Without mono monitor connected. As i know all
STE's have composite signal except French ones.

> Is it possible to get/make a cord to use a current mac/pc multi-sync
> monitor on an ST? That would make me pretty happy...

No. New Multisync dont support horizontal frequencies bellow 30khz and
for RGB mode (Atari, Amiga, 8 bit machines) u need 15.7khz.. U can get
older Nec (Nec3D) and u then can have all resolutions on it..

Janez

Hm lets make one thing clear... I NEVER said im against clones ir faster machines. I said its pitty that 060 wasnt even listed in CPU options. and that PC running emulator aint a solution i prefer. That is all.. People who dont dislike emus and such halfsolutions, they can get PC/MAC at this moment, they can run Gemulator, TOS2WIN, Maic.. and have fast machine.. If that emulator will be basic OS not on top of existing OS that in my eyes still dont make such machine an Atari.. And compatibility of such machine wont be any hgher as to run emulator on top. With some special and super accurate emulators (which wont pop out of the sky) it may be more compatible and also slower. Such emuluatpe would need to emulate Shifter as well, maybe even Videl, YM etc and that will eat a lot of CPU (as does in any emulator, emuxl from draco is manytimes faster as real XL, until it comes to Antic emulation which really slows all down under original XL speed, and hard video modes Antic can produce aint emulated yet. Thats on on 50mhz 030, so u can calculate the factor, and emuxl is one of fastest things arround, completely done in asm and optimized a lot) But thats no problem, because noone actualy dont want that, all just want fast GEM only machine, so they wont be ambaressed infront of ignorant PC/MAC ppl, which needs 100mhz just to print "hello world" on screen.

Derryck,
Tried it. Did'nt work! Note, the system never gets to a desktop (halts
first) so nothing is available to activate! I get a mostly blank screen
with only the message: "fatal error in gemdos....system halted"!
Thanks for the effort,
John

> a regular composite TV...

SCART is TV standard to connect VCR's etc... All u need to do is to
connect pin 1 (sound) from Atari monitor port to "sound in" pin in SCART,
pin 2 (composite) from Atari monitor port to "composite or video" pin in
SCART and pin 13 (ground) to ground pin in SCART.. or use RF
(antenna) cable..

> Are there spec's online somewhere that already explain all of this stuff in

> > faster
> > machines.
>
I think that depends on they way a clone is defined. Like I said
elsewhere in this thread I don't see a point supporting the old custom
hardware that might be needed to run demo's and old hardware dependant
games. At least not on the hardware level, if there is a great need to
run older stuff then it can be emulated. To stuff like that, it would
make more sense to use the original hardware in any case.

> I said its pitty that 060 wasnt even listed in CPU options.

Imo there would not be a market for 060, since it would not really
bring anything new out. You can get Milan or Hades with 060 IIRC. Why
put yet another one out if these clones are not good/fast/satisfying
enough?

> and that PC running emulator aint a solution i prefer.

I would agree with you there. Situation would in my mind be better if
an x86 board was running MiNT natively, although there are even nicer
alternatives around. Why not a PPC-board running MiNT natively? Or the
suggestion by Jo Even, to turn the Tempest into full system?

Yup. And stuff like demos are pretty much always written to work on a certain machine, that would not work on other clones either, like Hades or Milan.

> I don't know if you know about the bPlan board (http://www.bplan-gmbh.
> de). They're doing exactly that and the next AmigaOS and LinuxPPC
> will work on that machine.

No, not heard of that paricular project, although it sounds like a neat scheme! If Amiga can move on to a new platform, why shouldn't we be able to? Unless the XTOS project with a CF clone is a huge success and it shows that Motorola continues to develop the Coldfire series, I think we have reached a very dead end here by using the 68k cpu.

> You could easily port dozens of application without spending months on
> optimizations. Ported apps often don't look as fine as genuine ones so
> there's a place for both ones.

That is exactly my thoughts! We often have pretty nicely optimated stuff on the atari, so our native apps should be able to compete. Hopefully it would be possible to compile for the new CPU (possibly PPC then) by adjusting compilers for the various languages used. Not saying this is easy, or that I know how to do it, but it should be possible to make a C compiler or GFA compiler spit out PPC code instead of 68k code I think. Probably much easier for the C compiler though.

> I'm using a PC (but I still have my Falcon though). Why? Because my
> Falcon was much too slow for web sites and there are some apps which
> just don't exist on the Atari. It would be great to have a fast TOS
> clone with a new extended TOS.

Indeed. At the moment I need to use the PC pretty often to do stuff, I'd be happy if I could have a powerful TOS clone that would be able to do all I want. But it is getting harder and harder to justify the use of atari to myself.

>
> >It might not be what everybody wants, but it would at least

This sounds most interesting to me, as it appears as if most of the
work might already be done here! Have you mentioned this idea to Sven
Karlsson?

Regarding 030 emulator, isn't such a thing used for the Tempest already?
Or can it only be used by Fenix and not MiNT?

Also, using an approach like this, the Tempest would be happy to run
both programs compiled for 680x0 and PPC, right?

>are there some settings I can change? I am using it text only.

I used to have the same setup with my 1040STe. Cab 1.5 is slow, but
works fine. I would highlight the option to operate Cab without
graphics. This will speeds thing sup alitlle. I would also get Cab 2.8
with is alot better than 1.5. 2.8 also is has cookies which is needed
for most websites. Still, you should be able to get on most sites with
1.5. It will just take alittle more time.

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 30th, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

5,000 square feet of indoor space and an additional 5,000 square feet of
outdoor space is available along with ample parking.

Setup: 29th, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

Just a few days to go!!!

As of 06/24/2001
User Groups:
Erie PA Atari Group

TI Chips
Cleveland Classic Atari Group

Vendors:
1632 Systems-From the UK!!!
C.S. Vintage Games
L.R.O. Computers
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
John Legg-From the UK!!!
Chuck Amicone
David S. Brain
Vince Briel
Harry Dodgson
Alan Hewston
Thomas Mclaren
Michael White(Bally/Astrocade)
Classic Gamer Magazine
John Litva

Special Guest!!!
Pitfall Harry

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room-MAME, etc.

We already have one person bringing a Crazy Climber cocktail arcade game, John Litva. And, another vendor has promised to bring several arcade games as well. Please email us if you wish to bring an arcade game to the show.

We have a food service this year! The wife of one of our organizers, will be providing food, soda, and such!

Attention Atari ST/Falcon/TT users!!!
If you want anything from 1632 Systems, please contact:

Nick Harlow
http://www.1632systems.co.uk/
http://catalog.zen.co.uk/actinic/1632Systems/

Also, we have been told that a CCAG 2001 specific Atari 2600 game will be available for limited release!

See ya at the CCAG!

Source record: 44462

Newbie TT030 owner looking to find one of the mysterious video cards or ethernet networking crds.

I do understand that these are extremely rare, but I cannot find the site where I read that someone was creating new video and network cards.

If anyone can point me to a current FAQ, I could spare everyone a bunch of old questions.

Also, are their any users or user groups in the northeast part of the US particularly NJ, PA, or NY.

Lastly, are there any magazines online or otherwise or active websites that will help me better understand a few topics including, mint, Linux on Atari, Networking, and video?

Thank you in advance for all of your support.

-Alex

> moment, they can run Gemulator, TOS2WIN, Maic.. and have fast machine.. If

Lots of people do this already. What does this tell you?

> that emulator will be basic OS not on top of existing OS that in my eyes
> still dont make such machine an Atari.. And compatibility of such machine

A computer that runs a TOS-compatible OS natively is "Atari" good enough
for me. Atari (the company) hasn't done anything for me the last 8 years,
so my brand-loyalty is zero.

> wont be any hgher as to run emulator on top. With some special and super

Not necessarily, but it will be as simple and stable (hehe...) as running
MiNT or MagiC on e.g. my Afterburned Falcon or the upcoming (?) CT60.

> accurate emulators (which wont pop out of the sky) it may be more
> compatible and also slower. Such emuluatpe would need to emulate Shifter
> as well, maybe even Videl, YM etc and that will eat a lot of CPU (as does

There are lots of emulators that does this already, so what's the problem?
Emulating obsolete hardware will be cheaper, easier and probably more
compatible than doing it in hardware, not to mention that it can be
upgraded easily. As for eating CPU - programs that requires certain
hardware usually also requires 100% original CPU-speed. A modern CPU would
be able to run several emulated ST's simultaneously, so I don't see the
problem here.

> in any emulator, emuxl from draco is manytimes faster as real XL, until it
> comes to Antic emulation which really slows all down under original XL
> speed, and hard video modes Antic can produce aint emulated yet. Thats on
> on 50mhz 030, so u can calculate the factor, and emuxl is one of fastest

This should tell you how slow a 030 is... My old 180MHz AMD K6 emulates a
MSX1 almost perfectly, and there's *plenty* of CPU left (80-90% perhaps).

> things arround, completely done in asm and optimized a lot) But thats no

> needs 100mhz just to print "hello world" on screen.

Ahh, so *that's* why I want more power. I've always believed that I just
wanted to do more, and do it faster, thanks for correcting me.

I believe he came up with this idea long before me ;-)

> Regarding 030 emulator, isnï¿½t such a thing used for the Tempest already?

Yes, but it's written for PPC's, thus not suited for existing hardware. Or
do you know anyone who makes fast, affordable computers with
PPC-processors?

> Or can it only be used by Fenix and not MiNT?

The Tempest' emulator runs under Fenix, but can run TOS, MiNT and possibly
MagiC (I say "possibly" because I've never asked Il Profesore about this).

> Also, using an approach like this, the Tempest would be happy to run
> both programs compiled for 680x0 and PPC, right?

Well, if you run Fenix you can. To run native PPC-code (i.e. not
translated 68k code) under TOS, MiNT or MagiC I guess these operating
systems must be adapted to launch these.

A sufficiently fast clone could emulate legacy hardware without problems,
thus allowing trackers, demos and games to run.

> Hopefully it would be possible to compile for the new CPU (possibly PPC
> then) by adjusting compilers for the various languages used. Not saying
> this is easy, or that I know how to do it, but it should be possible to

Well, if you could settle for a x86 you could always compile your
GFA-sources with GFA-Basic for DOS/Windows ;-) Compilers for more common
languages (c, c++, pascal, java, you name it...) is not a problem at all,
they exist already.

I emailed that unpacker to you days ago Ken, no sign of it yet?

On an SLM-related issue, I've written a couple of times in this area or in c.s.a.tech about powering the controller seperately from the laser - means that you can still use your Atari without that jet-engine noise! The newsgroup archives on Google should still have them.

Good point. It would make more sense for someone to simply code some
USB drivers for some cheap PCI card and extend the life of the
currently available 060 clones. Or other such drivers...

> I give up!!

What's there to give up? The 060 is not produced anymore as far
as I know, it seems to me obvious why it was not in that poll.
I even have an 060 machine and I agree it really had no place in the
poll, especially for a NEW clone. Chill. ;-)

I am an exmple of this. I've basically owned nothing but Atari computers since 1984, and fought tooth and nail against buying another machine, but eventually broke down and got a Mac, because there were sites that I needed to get to that Atari browsers just wouldn't work on, and if they did were incredibly slow. I still love using my Falcon much more than the Mac. If there was a very fast (PPC?) accelerator for the Falcon, or a very powerful (PPC?) clone, and they had ported Netscape or some other modern browser by that time and it would run reasonably well on it, I would never have chosen the Mac. But this never happened. Although if it ever does, anyone want to guess which computer will be going in the closet or on the yard sale table? :)

> Ahï¿½well,ï¿½letï¿½theï¿½flamingï¿½begin..

Well, you've got my support on this! :)

> wanna such app?

For me, it's a matter of whether it works or not. I would of course prefer a purely Atari-based web browser to a Netscape port. But is that ever going to happen? Probably not, if the way it's been going recently is any indication. CAB is no longer being upgraded, so that's out. Neither is WENSuite. Adamas is too buggy and slow, and hasn't seen a whole lot of progress recently. Highwire project has more or less faded out. Even if one of these gets an upgrade, it will most likely take too long, and it will be obsolete the day it comes out. What other options are there? Waiting for the promised browser that will never come? Or using a ported application that at least would get the job done? I choose the latter.

> And: i dont care about CPU too much, but as i said, i wana
> genuine machine, not a emulator! If u remeber Phenix project u can see
> that today good, genuine and diferent projects CAN be done.

What has come of the Phenix project? Haven't heard much about this recently, and it's been years since it was introduced, and it's not released.

Besides, unless you actually open up the case and examine the hardware chip-by-chip, are you really going to notice that the computer uses genuine Atari parts (which is no longer a possibility anyway) or really good, seamless emulations of these parts, which is what any new "genuine" machine will have to do anyway to remain compatible anyway? Probably not. As far as CPU speed, I moved from my 8-bit, to my ST, and eventually to my Falcon because I wanted increasingly more power to be able to run more modern software as it was released. I eventually got a G3 Mac because the Falcon was either underpowered or lacking much needed software (like a good browser). If there was a good, superfast Atari that had good modern software, that would never have happened. But these things don't exist. So we need other alternatives.

> So u re right apps can be made, but it seems ppl who LOVE their

> new machine developers and company will just pop out?

You've hit on a good point here. We have a catch-22 situation that *must* be resolved here. We need better hardware before we can make better software. However, the newer hardware won't get sold unless we have better software for it. If the new machines don't sell, then the newer sofware won't be made. Etc., etc... If there is going to be any advancement, then we need something to break through this barrier. My suggestion: Make hardware that is fast enough to run ported apps extremely well in addition to running Atari software at a high level of compatibility and speed, then port all the apps that are currently available to port. This should all be done by either one company, or a coalition of companies, so that the release of the hardware and software happens simultaneously, and maybe the new hardware can come with some of the ported software included to add interest. Once this is done, people will hopefully see the hardware *and* software is available and buy these machines, spurring on more "native" software development.

> on those machines..

This is the problem. It is inevitable that software requirements will make the m68k family obsolete (if they haven't already). You were mentioning the mp3 player and such as an example. For these kinds of things, the programmers are needing to do incresingly more programming tricks to get these to work. This adds to the compatibility problems as newer machines come out, because the more tricks programmers have to use, the more hardware-specific the software becomes. As this happens, we are getting more and more tied down to one set piece of hardware, instead of having software that is more cleanly written and usable on more than one specific computer. As an extreme example, what if Atari had died at the 8-bit stage. Have you ever seen an 8-bit Atari capable of playing mp3's? That's eventually the state our current m68k-based hardware will be in if we don't move on to newer and better hardware. You *will* have to buy a PC or Mac if we don't agree to change processor families, port software, etc. There's no choice about that. New standards will become set in the computer world that our machines are completely incapable of handling, even with a 68060 and a DSP. Ten years down the road, the two or three people still using Atari's will be stuck using the 1998-2001 versions of Calamus, Vision, and CAB, while PC/Mac users will have new things not even imagined in 2001, which would possibly be portable to the Atari machines if we had kept up with technology. But oh well, that's our loss... It's called progress. Sticking with the old way is always the fastest way to extinction.

Yes, but the original question addressed "standard" copy programs,

A desktop copy, or a simple disk copy program is going to call the
standard desktop format routine which will just do the entire disk- a
"normal" format.

Obviously if you know how to program the individual chips, or how to
write programs that call low level routines, you can do some pretty
nifty things, but that's beyond the scope of the original question.

Yes- the pins mentioned need to be connected to the composite video
input on a TV. Ground goes to the ground on the TV input, the
others have to be combined for the video in signal. Usually there are
some resistors involved, although I have no idea what the values may
be. Hopefully someone else has more detailed info available.

Another thought- check on eBay under their "Vintage Computers"
category. You'll find lots of people selling Atari hardware,
including monitors, usually very cheaply.

>Hmm.. me thinks this is an Amiga user based on amiga thinking and not
>much knowledge of the Atari!

I posted a text on copy-protection problems which reffered to possible
use of an Amiga to solve the problem. I have not been deeply into this
problem, but I think that some of the criticism this text received
is unjust. Maybe I made a mistake of not posting the complete text,
but just some portions of it, which maybe gave way to misinterpretation.
The text was a conversation from the pacifist-emulator mailing list
which I saved a couple of years ago, so I think it it unlikely that the
author is some die-hard Amiger.

His message states, briefly, that, because of its design, the WD1772
controller can read some data which it can not be commanded to write- and
vice versa- which creates possibilities for copy protecting disks.
He suggested that an Amiga might be of help in some of such cases,
because of hardware differences.

>The Amiga can't always copy it's own disks, and the data on Amiga disks
>isn't that secure. At a bit level you can store around 7.5k per track,
>which means that an 11 sector (using 512bytes) will be pushing it for
>data security.

Probably- but neither I or the original author stated that Amiga's way
was better- just different, and he stated that it may be more suitable
to meddling with strange disks.

>>>>Is it possible to bypass the MFM controller that the Atari uses so that
>>>>it reads what is really there, not what it thinks is there? Is it
>>>>possible to access an Atari formatted disk at the individual bit level?
>
>Yep the atari can write and read 11 sector per track disks, but you have
>to have good quality of media.

But here is talking about different things. First one is thinking about sync
marks, sector headers, etc. and the other one is about non-standard

number of sectors.

>>>That is not possible because the Floppy serial data in and out lines are
>>>connected to the WD1772 MFM controller.
>
>It isn't!!! That's news to me!

But it is- see the schematics. Ok, there is a 7406 buffer/inverter between,
but it does not matter- floppy data and control lines go to/from WD1772
(except drive select signal). The original text was a conversation
between two persons, and the first one asked if Atari CPU can directly
control each bit of information sent to a floppy- to which I think that
the correct answer was NO- as quoted above.

>>>ST/PC uses MFM to write a bit to a magnetic media:
>
>The amiga doesn't use magnetic media!!!

Sorry, I don't understand this remark?

>>>The Amiga does the following in GCR coding, (the MAC does similar on DD
>>>disks, but other code, also the C64 used GCR code!!!)
>
>It does what!!!!

In the original text this was followed by rather lengthy examples of
MFM and GCR data encoding, bit by bit, which seemed more-less reasonable
to me. There were also examples of sector markings, etc. etc.
I don't suppose all that was invented by the original author just then,
so I suppose there is some substance in his explanations.

And so the man just said that Atari and Amiga use not only different file
systems but also different low-level data encoding- so what?

>Yes it's a different system. So maybe thats why the Amiga runs slower
>that the Atari/pc while accessing the disk, and gives that annoying
>click from the drives!

Probably. But, again, noone was arguing Amiga's way was better (I can quite
believe that it was worse)! Btw. I sort of remember reading somewhere that
this is due to a "slow" file system on Amiga.

>>>Now let us play copy protecting...
>
>This is going to be fun:)
>

My impression was that the author discussed protection methods in general,
not strictly referring to Atari, e.g. tracks 80, 81... which are quite
readable/writable on an Atari are not exactly "standard" format.
Also, the disks need not necessarily be produced on an Atari.

> But we are suppose to be talking protections that the ST can't do.

And I suppose that anything which an average user can't -easily- do can qualify as a sort of copy protection- AFAIK some are better than others and some are just stupid.

Hi John

> Tried it. Did'nt work! Note, the system never gets to a desktop
>(halts first) so nothing is available to activate! I get a mostly blank
>screen with only the message: "fatal error in gemdos....system halted"!

If this was my machine, by now i'd have made sure that my
hard disk driver had background DMA switched off,

I'd have disabled all auto folder app's except magxboot
I'd have disabled all Accessories,
hidden all icon files,
deleted magic.inf,
delete applicat.inf
hidden the start folder,
hidden the extensions folder,
hidden all CPX's.

I'd have a system where /only/ magxboot loads.
If that blew up its time to check for disk corruption!!!.

Have you changed your hard disk driver recently, what do you now use?.
If its ICD then thats a potential problem, or for that matter if youve
re-partitioned recently with ICD then thats a major problem, magic only
likes AHDI compatible partition schemes.

Are you able to visit the Cheshunt Computer Club this wednesday with
your machine?.

Sounds cool, just would be nice if Istari/Fmax could keep their info on www up to date ;) But I guess an idea like this is not likely to be published on the web before something has been decided, to avoid rumours.

Well I did get the impression that you were talking about possibilities to use either PC or PPC board. Perhaps it could be interesting to look into the stuff that Matthias Jaap mentioned, about the PPC board that supposedly will be used to run Linux and AmigaOS under PPC.

TOS is probably not that necessary to port but I would think that MiNT could be adjusted to achive this. MagiC is (I think) in asm and might be hard to adjust, not saying it cannot be done though.

I have used Yamaha CD writers for very long at home (in my Hades and Falcon)
and at work, never got any problems with them.
My brother had one minor problem at his Mac
so he needed a firmware update but it was only a Mac <-> Yamaha problem.

I used to have the same problem on my Falcon on a regular basis, and
never on my TT. It usually happens only when I fire up the Falcon. The
only way I've found is to reboot the system when there is this screen,
either with the reset button or with the key combo ctrl-alt-del (or
ctrl-alt-rshift-del).

Bye,
/Pascal/

Hi all,

After a few requests, we decided to make a SDK CD with the following:

ï¿½ The GCC kit
ï¿½ GCC Shell, registered version
ï¿½ Ressource Master, registered version, with paper manual
ï¿½ Windom libraries with their printed documentation (200 pages)
ï¿½ EZ Edit text editor (with syntax "colourisation")
ï¿½ Many development libraries
ï¿½ Many development tools

All this for only 49.00 Euros!

(reminder: for active developers the price remains 75.00 Euros for the
SDK including MagiC).

Have a look at the MagiC SDK page (in French):
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Best regards,
P. Ricard (ES)

Hi Mark

Thanks...it has been a rewarding effort. The good news is..there is
still more coming! You never knew there was so many Atari programs
coded!!

So far on my page I have 65 downloads! There are more on the
Atari-Midi file section as well as the newly created Atari-Midi
Archives site. Both links are on my site.

If anyone else here (programmers, ect) has any Atari-Midi applications
I would be happy to represent it on my site. My site is not fancy,
just basic HTML, with screen shots and tutorials, ect representing the
different programs.

If anyone wants to start ther own Atari-midi web site, feel free to
use any of the screen shots or downloads from my page...just don't
sell'em! :-)

Don't know if my hear trainer qualifies, but you are of course welcome to put it up for download on your site if you wish. You'll find the program (hEARCoach) on my site, and it can be used to practise intervals or chords, both replay and input can be done via midi.

http://gokmase.atari.org

Just out of curiosity, are any of the programs on your site bundled with the source? Could be nice if the author has left the platform :)

Anyway, keep up the good work,

Joakim

I was never on hot mail. You must mistake me with another. As for cedarnet, I was never reprimanded with a letter... just a note that there was a complaint. Replied to the complaint note... No violation of usenet policies. Don't know what they sent to you.. If this standard was held up, usent would be as empty as the Aussie outback or the Alberta province

Hello,

I have the same sort of problem on my CLAB Falcon MKII. The
difference is that finally Magic boots. I always have to reboot 3
to 8 times before Magic appears on screen. Whenever the boot fails
I get the warning : Fatal error in Gemdos with bombs or, instead of
Magic, it loads TOS with the warning No NVDI or WDIALOG installed.
When a boot finally succeeds I get a blank screen during 30/40
seconds and then suddenly MagiC loads. Runs fine then. Tried
everything to cure it with no succes. My other (original) Falcon
doesn't have those problems, 1st boot of MagiC is always
succesfull. (both Falcons have the same order of prg in the
autofolder, same setup). Given up to cure this mysterious
behaviour.

Cheers
Dan

How about a programming poll? It would concern only coders
but I'm wondering what languages are used.. "C", asm, pascal,
basic and such. Maybe too specific, just an ideaa though.

In your dreams!

It's a customized chip, if I remmmember right the name of the chip was HART.

I have two of those here some where!
One was fully populated with all the options, MAC roms, Realtime clock extra
Floppy ports!

If I recall I could use them on Mega STE aswell as a updated MEGA 4:a..
I don't remember how it was on a TT030 or on a Falcon..

Regards!

Freddie

Hmm does this Falcon have an IDE disk? If not this is the cause of the
delay. You need to patch MagiC to avoid the delay.
(don't have the url right now)

Bye,

YES: David Snow has some of his programs with source. As a matter of
fact, an Atari-midi member took MidiSquare and created a much better
version! The source to Midi Master drummer is available. It would be
great if someone took this and developed it more.

What is it do you mean by failing? I have had things happen, but
nothing that I cannot fix. Most of the time it runs fine and I have
used CD Backup many times to back up my hard drive. If you can find a
Plextor, I would get that. I hear they are more reliable and quiet.

Hello,

I bought a used 3 gig Seagate external SCSI drive for only $30. It works fine with my Hades system. The only thing is that I have to turn off Kobold if I want to use it. I cannot copy anything to it when Kobold is activated. It is the same situation when I try to copy from certain CD Rom discs. I guess it really does not matter since I am planning on using the drive for Linux, but I was wondering if anyone has any ideas. I partitioned the drive into one big 3 gig partition. Could that be the problem?

I have not been able to use the cartidges on the Mega STE, the software
fails it's software test. HOWEVER, there's no reason why the other bits
shouldn't work, extra drives or even the mac side of it.

So I can only use the backup side via an STE.

The Falcon may have a problem, as it doesn't have an external drive
socket for drive b.

I don't know Kobold at all, but I'd suspect that Kobald is having
trouble with the large drive either due to a programming limitation or
an incorrect sector size. You can't do much about the first, but you
could verify that your HD software has the sector size set correctly.

Oh I still post these messages to comp.sys.atari.announce. AFAIK that
newsgroup is moderated so if the moderator -for whatever reason- doesn't
let them through no one will see these postings.

The first boot screen shows the magxboot.prg loading - it's meant to run, and
then perform a warm boot to load the magx.ram file.

Centek CT2 owners will recognise the tip about issuing that key combo to kick-
start the second boot.

I wonder if it would be worth John's while to try the alternative
magxbot.prg, the one I use is called magxb032.prg

I would have a hunch ;))

I agree 100% that a decent browser could perhaps keep a few more users
from migrating. Since there are no up to date browsers for that atari I
certainly think it would be better if ppl used a port of an existing
browser on an atari clone intead of starting to do all app stuff on
other platforms.

I'm afraid that's not possible, unless someone decides to write a new
GFA-compiler. There's plenty of compilers for other languages though.

If something cool ever does come down the pike, and GFA is left
in the dust, I have enough information on the tokenized format to
produce some sort of converter, to "C" or whatever. Beats having
to do a total re-write even if you can't get a perfect conversion.

I've heard quite a few failing to write and lasers going. Not software
problems but serious hardware problems. I would get a Plextor but they're
expensive but damn good. I'm looking on ebay now for an old 4x write sort
of thing.

Yes it does, there should be an option to install AHDI in one of those
programs. If not then you'll have to download it from somewhere else that
does have this program in its archive.

1061. ROM based ethernet adapters

Newsgroup: comp.sys.atari.st
Date: 2001-06-27 17:50:03 UTC
From: madmax@bfree.on.ca
Message-ID: <7b81f281.0106270950.1ce2f2d4@posting.google.com>
Source record: 44428

Having followed the previous thread in which the URL for the ROM based ethernet adapter was posted 3 times, I decided to check it out. THis device seems perfect for my needs. (I NEED ETHERNET;-).

That said, unless I have read the page wrong, there doesn't seem to be any of these devices available any longer.

Is this correct?

I could use a handful.

Later Brian.

> Could that be the problem?

So this is a Linux (ext2fs) partition? In this case Kobold might have
problems accessing it, indeed. I think the last version of Kobold was
released before such partitions were usable for the Atari, or at least
before this partition type was used by a relevant number of users.
Note that in any case it's not the drive that causes problems but the
partition setup. Kobold does not know the drive at all. The only
software that knows the drive is the hard disk driver. And even the hard
disk driver does not have to care for particular drive models.

I'm not all that familiar with GCC, other than compiling some
canned stuff by typing "make". I can read "C" up to a point
but I'm not real good at it. Can you perhaps elaborate just
a bit so I get an of idea what you mean?

If you're not using Kobold 3.5 and have set the drive to use long file names this might be the problem. I use Kobold but the earlier version could not read partitions (10 x 2G) that were set for long file names.

I am forwarding this from Atari-Midi. Neil Wakeling, programmer of
Pulsar needs some programming help!!!please reply directly to him!

thanks

Tim

Hi all,

This is concerning the re-programming of PULSAR.

I have been redoing the timing code to use interrupts instead of
polling the
sytem 200Hz timer.

Can anybody help me (and stop me tearing out my remaining hair) with a
few
small issues concerning programming the MFP timer in C or assembler?
I
can successfully get the timer to call my interrupt vector, but I am
having
trouble finding out/ or coding how to re-trigger the interrupt or tell
the
MFP that the interrupt has been handled.

Please reply off-list to : neil@tuva.demon.co.uk

Many Thanks,

Neil

Have you considered doing a GFA-frontend for GCC? Not only will you get a
decent compiler, but you'll be able to compile GFA-code for almost every
CPU out there. And you could extend the language too.

I could work for 2 years in isolation, and then fail to produce the perfect AES. ;-)

> 913 was alot better. Lets see how it
> goes. Incedently how do you set up a console window under Xaaes? I had to
> resort to tos2gem and it aint pretty?
>
It is the way it is. The AES is for running GEM programs. If you want a console under
GEM, a GEM program must do it for you.
GEM must not become a GEM app itself. A line must be drawn there.

Hello,

our ISP, Utfors (http://www.utfors.se) have been very unreliable lately.
We hope that the ISP will perform better in the future.

You can read a more detailed text on our Websites news section,

Well, I have used a megafile 30 and SH204 with the Mega 4ST so I dont think
its a faulty DMA chip. Funny thing is also my SH204 wont work on my 1040STE
but Ive heard that the 204's have problems on the STE's for some reason.

> So you can still hope.
> Gerhard

Not to forget the that ST X-FORMER is actually quite fast, handles the disk images faster than normal speed, can run basic programs and even run Z-games like Zork and so forth quite well.
Drawbacks...

1) No emulation for antic/pokey chips. Image a bare bones 6502 Atari 8-bit
2) X-Former external drive setup to 1050 only works at 8 mhz.
(Though the program itself works at other speeds.)

At one time Derrick was going to tell me which lines to modify for a TT, but that never happened. Nice enough guy, and the emulator is the best for a 8 mhz ST I've seen yet.

BETTER OPTION...

Pick up a 800 XL, get a SIO2PC cable, and then run virtual drives on the ST for the Atari 8-bit. That way the rather inexpensive 800 xl will take care of the antic/pokey functions, and all the ST has to do is supply the 8 virtual drives and take advantage of the hard drive space of the ST!

If you want a "external 8-bit module" then get a XEGS, which looks in case style like a ST product... same grey color and everything!

Let me know what you think of these suggestions,

Doctor Clu
User of a Atari EST (eight/sixteen/thirty-bit) setup.

Welcome to the world of Atari. Seems to have been real strong as a
computer from 1985 to about 1995 or so, but then, there was still a following
for this platform when I first found out about it in 1998, and there is still a
following now. I like it for desktop publishing, .mod music making, BBS'ing,
Macintosh emulation, and as a virtual drive setup for my Atari 800.

To get good information on Atari history, check out...

http://www.atari-history.com

Or for a awesome bit about the sixteen/thirty-two bit line...

http://www.atari-history.com/computers/16bits/a1632bit.html

And to get a good idea about prices... keep watching here or try ebay.

How's that for an answer? :)

Take it easy, and if you have a moment, check out every Thursday at 8 pm
CST the Atari chat at...

Source record: 44310

FamilyNet Newsgate

Hi folks, I'm currently trying to get a CD rom drive configured properly with Extendos. I've managed to get my Chinon CD 431 (I believe it is) working as far as being able to fast forward, reverse, and stop. Play doesn't work, but I can usually get that started if I go to the record area and hit the musical notes.

Anyway, any suggestions, or is there a site with the extendos documentation? I probably have it somewhere.. packed away in some box... Hehehe...

Figure since I'll be keeping the ST around a little longer I might as well get those annoying kinks ironed out. :)

Later,

Doctor Clu

>configure HDDRIVER properly.

It does. If the versions are found not to match when HDDRUTIL is run, it should still run so that the driver on the hard disk can be updated. In this case, the load does not complete. I think that the error message is referring to the fact that the utility cannot load the data from the program that is later used to copy to the drive when the driver is installed (?)

This is definitely connected to the CT2 card, for I can access the program properly when the Falcon is switched to "Atari" mode.

I'm wondering now if there is some corruption in the NVRAM actually.

Could it be that your DMA chip is faulty ? IIRC some ST machines had small signal diode (like 1N4148) between DMA chip's Vcc and system's Vcc. It was soldered manually as chip's pin 40 was twisted 90° and diode was soldered between the pin and the nearest convenient Vcc point on the PCB...

You should also check whether other drivers than AHDI do not find this
drive. Most drivers packages (except for HDX/AHDI) include software that
does a device check. Wrong termination or bad cables are usually the
explanation for drives not being recognized.

Using MAGXBO32 or MAGXOBOOT only makes a difference if you also have the virtual memory manager OUTSIDE or ROMSPEED installed. (See http://www.seimet.de/atari_english.html for more information.) If you don't use this software it is not relevant whether you boot MagiC with MAGXBO32 or MAGXBOOT, except for MAGXBOOT saving some RAM compared with MAGXBO32.

There is none, indeed, because the ICD software does not support
background transfers. Only CBHD and HDDRIVER do.

> How about Jeff MiNTer... lol

I believe he is referring to "Jay Miner", the co-creator of the Atari
400/800 chipset and later one of the developers in the Amiga chipset.

http://www.cris.com/~jws/TheMission/JayMinerLinks.html

I too have been tempted to walk the route of Jay Miner... I have a Atari
800 (which I call "Mini-Amiga") (putting pinky up to mouth in a Dr. Evil kind
of way), and maybe someday I'll walk the path of Amiga.

But that will take money and to vere off the Atari path could get way to
expensive. Oh well, guess Atari 400/800 will have to be my sampling of Mr.
Miner. :)

Welcome to the world that is 'Atari':)

There is a HUGE amount of stuff hardware & software for the machines,
ranging from basic tetris programs, to full pledged dtp and music
programs.

Hardware.... SCSI drives, eprom programmers, scanner, the list is very
large.

Prices all depend where you live AND what you are after. I sell quite a
bit of Atari stuf, not just ST but also Falcon, Portfolio, Jaguar, 2600,
7800.... or anything i can get my hands on. The Atari Software eXchange
- www.the-asx.co.uk

I also took on the former LAPD pd library, now LaST PD. www.last-
pd.co.uk

I also have the odd spectrum, amstrad software machines etc.

I am based in the UK, but can ship to anywhere in the world at buyers
expense.

An ideal entry point would be a 4 meg STE, althoug not 100% compatable
with older stuff, it does run the new stuff that is STE/falcon only.

Look for the Atari FAQ on the net somewhere as it is being updated
sometime. I would look out for either the STE or a Mega ST or STE. The
STE is like an ST but with enhanced graphics and sound. The mega comes in
a desktop style case and the Mega STE has faster processor and cache. For
an old ST you should only be paying about 30 dollars for a system with
games. The Mega may set you back 100 dollars depending on whats included.
Shop around.

1102. MagiC 6 & 1.44Mb floppy mod STE

Newsgroup: comp.sys.atari.st
Date: 2001-06-28 18:25:47 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3b3b76ab$0$13980@news.zetnet.co.uk>
Source record: 44317

Hi all!

One of the offline members of the Cheshunt Computer Club has been having a weird problem with his STE.

The problem is that when using MagiC v6.01 (Jinnee or MagxDesk) most of his high desnsity floppies exhibit the "Data on drive may be damaged" messages when trying to run programs on these disks.

However in TOS (v2.06) these messages do not appear and programs on these disks work normally.

The STE has 4Mb of RAM, and the TUS (The Upgrade Shop - a former UK dealer) 1.44Mb floppy drive modifcation. He also has the TUS switchable TOS upgrade (v1.6x/v2.06), which was installed at the same time as the HD mod.

Of course we've tried to eliminate any clashing programs by running a clean setup, just MagxBoot and the TUS_FDC.PRG (the driver program for the mod) and no accessories/CPXes loaded, but the problem still persists.

Does know if there was a problem with the driver program or perhaps if it is incompatible with MagiC?

Cheers!

James

Take a look at http://gcc.gnu.org/ (IIRC), look under "front-ends".
Ofcourse, if you don't know C (which I believe most, if not all, of gcc is
written in) there's not much point in messing around with gcc. But if you
could write a GFA->C converter that would ofcourse work just as well.
You'll probably need a set of functions or macros to replace much of GFA's
functions, but that shouldn't be a problem.

Would be good as a last resort ;) The real thing is of course a better solution, if it is only possible.

Perhaps it is not entirely impossible for someone with great insight in GFA matters (rgf, lp, run! software to name a few) to team up and look into making a compiler (or would new libs be enough?) so GFA would be able to spit out PPC code. Maybe, just maybe :)

Ah well, I'll keep on dreaming :)

No, it is a regular GEM partitions. I am eventually going to use the
drive for Linux. I believe I chose the partition type as "F32".

I second that. I have and played Ultima 1-6 on my Atari. I bought 7-9
for the PC and will play it later. I will say that if there existed
version 7-10 for the Atari, I would buy them. If you do not have Ultima
for the Atari ST, I would buy them from this guy.

Does he have an external drive hooked up? I have a 1040STe and I cannot
read/write some disks inserted in drive A if I have an external drive B
hooked up. When I disconnect the drive B, drive A works just fine.

1122. Misc ST Items and Books FS

Newsgroup: comp.sys.atari.st
Date: 2001-06-28 23:39:11 UTC
From: fmhcom@operamail.com
Message-ID: <zeP_6.16659$K8.5322@newsfeed.slurp.net>
Source record: 44338

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.

Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $40.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

680X0 Programming by Example. Published by Howard Sams & Company.
An Assembly Laguage book for the 68000, 68010, 68020, and 68030
line of chips. Has a ton of code and illustrations.

The Atari Assembler. Published by Reston Publishing Company.
A very illustrated book covering Assembly on the Atari 8-bit.

Atari Roots. Published by Reston Publishing Company.
A guide to Assembly Language for the Atari 8-bit computer.

Atari ST Application Programming. Published by Bantam Computer Books
A nice C programming book with lots of examples.

The Atari ST Book. By Ralph C. Turner.
Tips, Instructions, Secrets and hints for the Atari ST line
of computers.

Atari ST GEM Programmer's Reference. Published by Abacus Software.
A complete guide to GEM programming with C.

Atari ST Internals. Published by Abacus Software.
Book covers every processor, chip, component, and register
in the ST all in Machine Language.

Atari ST Programmer's Guide. Published by Weber Systems.
Focused towards the beginning ST User/programmer.
Covers BASIC and LOGO

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Compute's Atari ST Machine Laguage Programming Guide. By Compute Books.
A very good book on Assembly for the ST.

Compute's ST Applications Guide programming in C.
A clear and comprehensive guide to writing Atari ST applications
in C.

Compute's ST Programmer's Guide.
Covers BASIC and LOGO.

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples.

Intermediate and Advanced Atari ST Subjects. by Ralph C. Turner.
Covers topics like hard drive management and optimization,
Running IBM programs on the ST, Connecting SCSI devices and more.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

Programmer's Guide to GEM. Published by Sybex.
GEM Programmers guide in C.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
Sept 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

But as far as I know it's Falcon specific. At least it was when the
project startet.

BTW, the 'Atari800' emulator, which is in my opinion the most complete
emulator at this time (runs nearly 100% of all games !), is usable on
Falcon, TT and Hades at least. For some time I have been working on the
assembler part of it, trying to speed up things, but for two reasons,
one being a major rewrite of the antic emulation that's in progress at
the moment and the other non existing user interest I have not been
working on it for some month now.

> (forgot why I don't).

At least old versions of the ICD software are known to have caused
problems with MagiC in the past. You should simply try whether the
current demo version of HDDRIVER
(http://www.seimet.de/atari_english.html) works for you. If it doesn't
you can be sure that this is not a problem related to the hard disk
driver, but something else. If it works it is very likely that your
current driver is not working correctly.

Well, sounds like the war cry for beta testers. ;) Where can I find this emulator? If nothing else I'll have it plonk away on my 1040STE or my Adspeed 1040ST (at 16 mhz)

Should be fun.

I'm currently playing with Magic 5.03 on my 1040STE with ICD drivers for
the hard disk. So far all is working fine, and I have to say that I'm very
impressed with Magic. Multitasking.... drool!

I saw recently here that 63% of people here prefer a PPC in a new TOS machine :

Apple may buy the PowerPC from Motorola for 500 Million $!
http://www.theregister.co.uk/content/39/20038.html

The new G4+ low power : PPC7440 : 2 times cheaper than the P3 mobile from Intel !
http://www.theregister.co.uk/content/archive/19118.html

G4 APOLLO from Motorola : the 1 GHz PPC !
http://www.theregister.co.uk/content/archive/13889.html

Note that there are no data in the NVRAM that have any influence on the
driver installation. The NVRAM only contains well known data and the
only information in the NVRAM that has anything to do with booting from
hard disks is the boot preference. (The Milan might use additional data,
I'm only referring to TT and Falcon.)
If this only happens with the CT2 card you should ask Rodolphe Czerba
for assistance. BTW, HDDRUTIL does not contain self-modifying code and
is definitely compatible with the 68040 and 68060. It's almost
completely written in C (Pure C).

In the Auto folder, run as the second item after your boot selector if you
use one.

It makes no sense to put it anywhere else.

As someone else suggested, if you can get past this error problem and if you
don't have an IDE drive, then you might have a wait until MagiC times out
searching for it. There is a patch to avoid this around, but I can't remember
the URL I'm afraid.

1141. [NEW] July release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2001-06-29 11:59:51 UTC
From: Francois Le_Coat/mailaxis <lecoat@ief.u-psud.fr>
Message-ID: <3B3C6DB7.22ACF4A5@ief.u-psud.fr>
Source record: 44353

Hi all,

I just released on my web page, the july version of Eureka.
It's a 2D Graph Describer, and a 3D Modeller. The major
improvement of it, is that multitasking is better handled
with MagiC Mac. You will see that the desk of Eureka is
disappearing. The software is better integrated in a
adequate environment.

I'm also launching a call. If somebody that would have
both knowledge in Maths and French, would be so kind as
to help me to translate the text in the formulas of
Eureka, it would be nice. The formulas in themselves
are not a difficulty, but the comment on it is for the
moment in French, and it may be an obstacle for many
people. The 2D curves, and 3D surfaces are in the *.FMU
files, and it is plain text files. That can be edited by
a simple text editor. My knowledge in international
mathematics are two basic, so I need help. Thanks in advance
for your help ...

Best regards,

I've got a Falcon with 14 meg of ram running Neodesk and Geneva (both the latest releases), and would like to know if NVDI 2.5 or 3.0 would work well with these.

Thanks,

Bill

1144. Bad Sound Chip Help!

Newsgroup: comp.sys.atari.st
Date: 2001-06-29 15:42:58 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <3B3CA196.E26C647E@ataritimes.com>
Source record: 44355

I'm fairly certain the sound chip in my 1040STe has been toast for awhile. I was having problems with the floppy being able to write files. Sometimes it would work, other times it wouldn't.

Today I hooked up the sound cable and there's a truly annoying buzzing instead of silence. So, I'm pretty sure it's flat dead now.

How difficult is it to replace the sound chip in this system? Is is soldered to the board or socketed?

Any recommendations would help a lot. I really need the use of the floppy!

Thanks,

1145. Copy Files From ST to PC

Newsgroup: comp.sys.atari.st
Date: 2001-06-29 15:46:08 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <3B3CA254.D96EDFEA@ataritimes.com>
Source record: 44356

What's the easiest way to do this without a floppy? (If you didn't see my other post: My sound chip is bad rendering the floppy useless.)

I have a STOS game that is 95% complete, but I need to get it off of the ST and onto a PC emulator to finish it. I was thinking of using a null-modem cable to connect them together using two terminal programs on each end for the transfer. (But I usually don't have much luck with that kind of thing.)

I know that's pretty much the only way, but I was hoping someone out there knew a better way?

Thanks,

1146. PC Emulator for STOS

Newsgroup: comp.sys.atari.st
Date: 2001-06-29 15:48:19 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <3B3CA2D7.B19ABD8A@ataritimes.com>
Source record: 44357

I've tried using GEMulator for STOS, but they don't seem to like each other very much. Seems the mouse isn't recognized by STOS when using GEMulator.

Is there a good STOS/PC emulator combo that works? Or is there a fix for GEMulator? I think the version I tried was GEMulator 98... I also looked at GEMulator 2000, but it doesn't seem much different.

Anyone had a better experience with STOS / PCemulator?

That would have to be a complete rewrite. I know that there are people
around that can disassemble a 100k binary, comment the code and improve it
(Hi Ozk!), but I'm not sure if I would do that with a compiler...

That's something else. A front-end in gcc-terms is the part of the compiler that transforms the source to a format the compiler itself can understand. Gcc has frontends for various languages, c, c++, pascal (with OO-extensions), java etc. GFA Basic should be possible too.

Btw. I'm not sure if the java-frontend works with MiNT/MagiC/TOS yet, but if it does you could compile java source and bytecode to real TOS binaries. Somebody has to port the libs though.

GFA the company would have you think such work is impossible.
It won't be me! I'm lucky to read "C" let alone assembler. ;-)
Such work has begun on the old GFA Editor, no it won't be GEM'ified
if that is what anyone things. It will have some of it's more
annoying problems fixed though, so that less patches and such
are needed. Some rather smart chap sent me the full source
which indeed compiles, how he managed to fix all the jump tables
is truley amazing to me.

I've ran across 2 GFA to "C" converts in the past but both of them
tried to convert ASC LST files. This seems to make the process
a bit harder, distinguishing varnames and such, misinterpreting stuff
in comments and so on.

The site mentioned on my GFA page reads GFA files directly I
think, I have trouble reading it and I cannot test it as it
does not run on the Atari. It appears to be for the PC.

1155. Re: Jinnee Icons

Newsgroup: comp.sys.atari.st
Date: 2001-06-29 16:24:49 UTC
From: Manfred Lippert <mani@mani.de>
Message-ID: <B762784E.57C7%mani@mani.de>
Source record: 44362

If I remember correct, the names of the icons must not have more than 10 (or was it 12?) characters!
This is a limitation of TOS.
If you write more characters under the icons, which only some Resource Editors will allow, than the Resource Editor makes same "tricks" to store the longer names in the RSC file. But if the application loads the RSC with system routines (like jinnee does!) than this application will not see the long names - it will only see empty names! :-(

So: Do not use more than 10 characters in the icon text.

And: It is the space for the text, that counts, not the text itself. If you allocate for 20 characters, but use only 3 characters, then it does not work either.
(But most Resource Editors allocate just as much space as the text really takes. But if I remember correct e.g. in Interface you can also define the allocation.)

Bye,
Mani

I honestly don't know about 2.5 or 3 as I was a SpeedoGDOS user back
then. I do know that NVDI 4 works fine on a 14 Meg Falcon running
Neodesk and Geneva, since that's my Falcon's primary setup.

He didn't have one at the club.

I'm wondering perhaps that MagiC perhaps takes up too many system
resources for the 1.44Mb clock to work?

Cheers!

James

That's putting it mildly, Francois. I'm a mathematican by trade, but I don't use Eureka much because dealing with French and math simultaneously gives me quite the headache!

Nonetheless, thank you for continuing to work on your program. When I do get things working, I'm rather satisfied with the results.

Yikes, that Extendos is a bit out of date, to put it mildly. I'd contact Roger's website (he's doing fine, by the way) for more data. Something you might try is to set the software for "autoplay" so that the CD simply starts playing when you insert it. That was added rather early, if I remember correctly.

Do keep in mind that CDR (& CDRW) drives have, in general, much more
delicate heads than regular CD-Readers. A brief survey I did about a
year ago showed that the manufacturers of CDR(W)s had MTBF ratings
around 1/3 that of the read-only drives. Consequently, I've avoided
EBay for used CDR(W)s.

With ICD utilities at least, the maximum sector size must be set
manually (2048 bytes, 8192 bytes, etc.). Failure to have the size
large enough creates some interesting read errors. Setting it too
large is harmless, but uses memory.

I'm not completely certain WHY the sector size has to be set, but I
suspect it has something to do with the caches.

How would MagiC be able to negatively influence the clock frequency of the floppy controller, which is set by hardware? Or do I misunderstand you?

So these errors must be something specific to the ICD software. TOS (and thus the hard disk driver) have to work with different logical sector sizes, depending on the partition size. When partitioning the correct sector size is usually calculated automatically, so the user does not have to care for it. Some tools allow to change the sector size, but it is not recommended to use this feature unless you know exactly what you do.

> I'm not completely certain WHY the sector size has to be set, but I
> suspect it has something to do with the caches.

No, this is because TOS has an upper limit with respect to the number of sectors a GEM or BGM partition can have. (Note that the number of sectors of the actual drive, i. e. the drive's capacity, is not limited.)

Or do you mean the sector size setting that is required for removable drives? Since TOS and the hard disk driver cannot know the largest logical sector size on a cartridge before it is inserted, you have to tell the driver the maximum logical sector size of the paritions of your cartridges. Otherwise partitions that have a larger sector size cannot be accessed. But again, this will not lead to read errors, but simply means that you cannot access partitions that have a larger logical sector size.

Even though you should always install the driver with the installation program that belongs to this driver in your case it should work this way, indeed.
But you should definitely only do it this as a last resort, because there is no guarantee that this will work for all drivers. In strongly recommend to get the complete software package for your driver, in this case HDX, AHDI and HINSTALL, and then install the driver properly.

Sounds like it. (heh, pun not intended)

>How difficult is it to replace the sound chip in this system? Is is
>soldered to the board or socketed?

I've seen a STE with the yamaha socketed and I think this is very rare.
Chances are you won't have it socketed and it is around 28 pin or so so
it's not easy or fun.

>Any recommendations would help a lot. I really need the use of the
>floppy!

Well, have you tried a printer on it as this is also handled by the
Yamaha. It might confirm it is this chip. When you say it has problems
writing, is it only writing? Have you tried another floppy drive or
external one? In the STE the DMA chip *also* handles sound and floppy
drive so it could be this messing up.

You could use a parrallel cable to conenct the two but if the sound chip has blown then your parralel may not be working! Use a null modem cable and a terminal like Conenct on the ST side along with HSmodem in the auto folder. Then on PC use Hyperterminal as part of Windows, or as I prefer, QModem from DOS (far better IMHO!).

In interface you have to pre-define the length, in resource master you can just type it in but its then not saved correctly and interface wont recognise it correctly either.

I find the best method is to use interface allocating 8 characters (more than enough for most uses). I have 140 megabytes of resources of various color depths and no probs at all.

No, haven't printed anything on it in awhile. I'll give it a shot though.

> When you say it has problems writing, is it only writing?

It will read the contents of a disk (although I haven't tried copying
anything from it.)

Would graphics be tied into the sound chip in any way? There are some weird
graphical glitches in STOS that never happened before I was having this
problem.

> Have you tried another floppy drive or
> external one? In the STE the DMA chip *also* handles sound and floppy
> drive so it could be this messing up.

I would try that if only I had an external floppy!

I remember replacing the floppy years ago thinking a new drive would solve
the problem. Since it didn't I'm guessing it's some other hardware problem.

Thanks for your input. I'm going to try printing now.

Just out of curiosity...
How are errors (either compile-time or run-time) handled in this concept?
If I understand correctly, it is fundamentally a C-language compiler
with some sort of preprocessor for diverse languages. But if the front-end
passes some source ok and the compiler complains later on or the program
crashes at run time, I suppose it may not be easy always to trace the
error to the correct (other language) source-code line and syntax?
Or is it so that the references to original source lines are kept somehow
in the code even though 1-to-1 source line relation is not maintained?

Well, I tried printing and that worked better than I expexted it would.
However, I have another suspicion as to what the problem is.

When I ran STOS a few moments ago, I wanted to quit, so I typed SYSTEM. After pressing Y and the Y/N promt, I received a "Bus Error" message. The message I was receiving from the desktop when trying to write a file was "Bus Error" as well.

I'm going to try unloading everything at startup. I'm currently running Geneva/NeoDesk4/NVDI which is a lot more than I need to copy a few files.

There are two programs that come to mind. One is Ghostlink. It requires
a Null Modem cable and comes with a program for the PC as well as one
for the ST. The other is PARCP. It does it's think use the parallel
printers and needs a special cable. I bought the cable from the author
and it works great.

Well, I tried the ole' null-modem thing... Unfortunately for me I'm using a hacked cable and it's pretty messy to look at. Anyway, what I had seemed to work: I would click Receive in Hyperterminal on the PC side and the ST (using AnsiTerm) would pop up with the select file box. I'd select my file and then nothing would happen. As far as I can tell, the settings are the same on both ends: 8 bits, 1 stop bit, & no flow control.

I'm also using the bare-bones setup for the cable.

Wire 2 is crossed with 3.
Wire 3 is crossed with 2.
Wire 7 is the ground connected to itself.

Wouldn't the ST work with a basic setup like this?

I said in my earlier post how I never have any luck with this null-modem thing. It's Kryptonite, I tell you.

HDDriver has an AutoPark accessory that will spin down and park drives
after a period on time. There's also SHIP.TOS, which IIRC I received as
part of an AHDI software archive, which shuts down and parks drives on
demand.

I simply cannot see how any software (and MagiC is just a piece of
software) would influence the clock frequency of the floppy controller
hardware, which is software-independent.

HDDRIVER includes software (an accessory) for this purpose. It works for
all SCSI drives and for those IDE drives that support power management.
(Any current IDE drive does.)
AHDI does not support something like that in general, in particular not
for SCSI drives. As far as I remember AHDI can only spin down the IDE
drive of a Stacy, but not by using the drive's regular power management
functions but by simply powering off the drive.

There is at least one problem with the SHIP.TOS approach: If you start
this program you have to ensure that you never return to the desktop.
Otherwise the hard disk drive is accessed again and thus may spin up
again. Did SHIP.TOS also work for IDE drives? I don't think so. It was
basically designed for the first Megafile drives, which did not park
themselves when shutting them off.

The Stacy has no IDE drive, it uses normal SCSI drives thru a
special ACSI-to-SCSI adapter; the same used inside the MEGA-STE.

I'm afraid I don't know gcc well enough to answer this. But I know there
are source-level debuggers for gcc, and compile-time errors does indeed
report line-numbers.

I'd rather improve these than converting tokenized files. The latter are
generated by the disgusting GFA editor (the #1 reason why I never learnt
GFA properly), while LST-files can be generated and edited by any
text-editor.

And atleast mine (with an original 48Mb(?) Seagate) won't boot with
HD-Driver, I have to use AHDI. I sold my MSTE long before I got HD-Driver,
so I don't know if this is a general problem with these SCSI-cards or if
there's something wrong with my Stacy.

>disks work normally.

I think magic doesn't know the STE can't change fdc frequency(this is
the TUS which change the frequency acording to the hole of the disk).

So Magic set the step fdc to 3 ms and change the frequency to
8MHz(this don't work and the frequency stay to 16MHz).
Then, the real step fdc is 3ms div 2 = 1,5ms. The floppy can't work.

On real TOS 2.06(on 520STE with a HD modification), I noticed that the
floppy go slowly with 720Ko disks. So I think the tos set step fdc to
6ms most of the time, except while reading the DD disk.

This doesn't sound too serious. Open the old STE up and clean it out
(watch out for the PSU!) and press down on all socketed chips. Waggle the
simms a little and you should hear most chips "creak" as they're firmly
pressed. See if that helps.

OK, so you don't use flow control but remeber that speed also matters so
select both terminals at either 19200 bps or 9600 bps. Also make sure
both are setup up for the right transfer protocol, ie Zmodem or Xmodem.
To check see if typing hello or something in one terminal appears on the
other terminals screen. If this works then it's a simple (well sometimes)
case of adjusting transfer protocols.

What I thought (when I talked to him) is that perhaps that the chip is
only just working in 16mhz mode as some can only take the increased
frequency and the way Magic accesses the FDC (in optimised assembler?) may
make the timings slighty wrong.

>not require any

It may make the TOS 2.06 report as TOS 2.00 but I'm sure MAgic is
compatible with High Density drives. It is a point though and it may be
something to do with the program not running as it checks the TOS cookie
and doesn't see 2.06. The only change I see it making is the step rate.
There are utilites that change the step rate on the fly, like an
accessoroy. Maybe it's worth checking one of these out and fiddling with
the step rate, I think it's supposed to be 6ms or 3ms, can't remember.

Ah, yes. So either the SCSI drive was shut down by AHDI manipulating the
power supply by software or it was not the Stacy at all but the Falcon
with its internal IDE drive. Actually it was long ago when I had a look
at that, so I'm not sure about the details anymore.

This is not a general problem. There are lots of MegaSTE users and also
some Stacy user running HDDRIVER on their machines. I even did so myself
some years ago when I had access to a MegaSTE.

I'm sorry, but this simply does not make sense. MagiC is not the only
software accessing the floppy controller in optimised assembler. Other
software (e. g. older versions of DISKUS or tools based on the floppy
code in the "Scheibenkleister II" book) does the same and there is no
problem at all. There is not much of a timing anyway because the FDC
reads/writes data more or less on its own by DMA when it receives an
appopriate command. "Scheibenkleister II" contains the details.

I'll have to take a closer look at it then. Unfortunately I managed to
toast the CPU in my Stacy while fiddling with overclocking this winter, so
I need a new 16MHz 68000 first.

One thing you might want to try is to remove the memory SIMMs and
reinstall them. This will help "wipe" any corrosion from the
contacts and re-establish a good connection.

The symptoms you've described are so wide-ranging that it's hard to
point to very many things that could be common to them all. Memory
problems are one thing that it could be.

You might want to run a good memory test program to make sure the
SIMMs themselves are OK too.

While you have the cover off, you might also want to remove the entire
RF shield (instead of just the memory "door") and reseat the TOS ROMs
as well. Flaky contact between the ROMs and their sockets can lead
to bizarre problems which can be hard to diagnose.

Most of the chips on the STe motherboard are surface mounted, not
socketed, which helps to eliminate one of the real problems of earlier
ST models, but the ROMs are usually still socketed. Simply pressing
them firmly down into their sockets until they make a slight "crunch"
sound can help re-establish a good electrical connection.

Be sure to check the baud rate on BOTH the ST and PC ends.

The PC defaults to 2400 baud, and I believe the ST defaults to 9600. A
mismatch will prevent communications from taking place.

As a test, you should be able to type on one system and see the
characters appear on the screen of the other system. (You won't see
the characters "echo" on the screen of the system you're typing on
unless you set the duplex to "half" or "local echo".)

If you see blocks or squiggles instead of the characters, it probably
means a baud rate mismatch.

On the other hand, since you seem to be able to command the ST to
start a transfer by clicking Receive File on the PC, perhaps the baud
rates are OK after all.

Are you using the same File Transfer Protocol on both terminal
programs..? Zmodem, Xmodem, etc..?

With "no flow control" set on BOTH ends, the basic null modem cable
you described should work just fine, as long as the transfer speed
isn't set too high.

This is one of those things that "should work"...

Stacy _did_ come with a special AHDI version designed to spin
down the drive, turn off the backlight, then the LCD itself as
power-saving methods. MACCEL supported it.

> text-editor.

Indeed. There are a few advantages to the token format since a
specific token can distinguish various command syntax especially
with some commands that have multiple formats within the one
command. The downside is the editor for sure.

There is a solution for the editor now, so gfa coders can code
with QED if they like and toss the old edtior in the trash if they
so wish. Announcement coming shortly about this new sloution in
another post.

The winner of my contest submitted a lst2gfa program, it's just
one extra step during the compile phase. In a sense the token
format has become a tempory file as of today, gfa coders
can now keep there source files as ascii.

The conversion does add some extra time to compile, but it's better
than nothing. Anyone interested in this can have a look at my
website.

I have a Mint dreamcast that I've used maybe 12 times since I bought it new 6 months ago. Original box & docs. included. 5 games: sega rally racing, flag to flag racing, blue stinger, NFL2K and Crazy Taxi. Also includes a 200 block memory card. If anybody has a nice Jaguar setup that they would like to trade please let me know what you have. Im looking for a good tradeup like a Jag with the CD player and games or something like that, Let me know what you have. Please e-mail me the info. at: pilot77@spininternet.com

Thank you!

Hi,
I did search here in Germany for such an adapter... but no luck
in the stores to get a Genius E3000II :-((
In a french Msg on www.deja.com I find out that a Accton EN2209
also has a RealTek 8012.... but this isnt no longer pruduced :-((

Now I found on the germn Ebay a ESCOM kt58-2209 (ESCOM which was a short
time the owner of AMIGA) and this work with the drivers for a Accton EN2209
and looks like one (should one be).

Now iam trying to get the ROM-POrt Adapter (from Elmar) and then I want
to use EtherNet with my Falcon :-))

Hopefully there will be a new EtherNetAdapter for the ATARIs without a VME-
Bus or ASCI....

Bye
Guido.

Fine. So as a probably final answer to the initial question about spinning down drives with AHDI it can be said that AHDI only supports this for the Stacy and the STBook and that probably MACCEL is also required for this. I remember that there was a CPX included with MACCEL in order to set this up.

For other machines AHDI or other software from Atari does not supply spin-down control. The reason for this is quite simple: Spin-down control as it is done by AHDI for the Stacy and the STBook is not a proper solution that uses the appropriate SCSI or IDE commands for spinning down/up the drive but uses a quite dirty proprietary solution that fiddles with the drive's power supply. IDE or SCSI commands would have worked for any kind of device, because this solution would have been compliant with the corresponding standards.
The lack of a proper spin-down/up mechanism is one of the issues addressed with the XHDI software interface (http://www.seimet.de/files/atari/xhdi-130.zip), which is supported in different levels of compliance by HuSHI, CBHD and HDDRIVER. XHDI not only allows to write driver-independent software for spinning down/up drives but also offers a lot of other useful functions. MiNT, for example, uses XHDI to access Minix and ext2fs partitions. Jinnee and Thing use XHDI for ejecting media from the desktop etc.

Tell me about it. Ok. Here the latest:

I know the cabling is good because I'm using premade, non-hacked cables.

On the PC side, I can type and the characters will appear on the ST.

On the ST side, I can type and the characters WILL NOT appear on the PC.

On the PC side I can start a transfer (using Zmodem) and the ST will pop up with a file dialog box. I send the file, and the PC eventually says that the connection timed out.

So, I'm concluding that maybe the ST's serial port is messed up, which wouldn't surprise me one bit. It can recieve, but it can't send.

Any ideas left?

Since you haven't mentioned if, have you remembered to install HSMODEM?
There are a few (?) bugs in the serial port handling routines that it
fixes.

I'm using some serial fix... SERFIX.PRG or something like that. I can't remember.

With my current situation, I may not be able to get HSMODEM to copy anyway.

All this would be so much easier if Atari put a floppy drive in their system... Oh wait... A floppy problem is the reason I'm doing this in the first place. Silly me.

Maybe it's time to get a Falcon. How much do they go for thesedays? And is it possible to use a SCSI hard drive that was already formatted with ICD software to work with it? Does STOS work?

Argh... sounds like a good conclusion.

>Any ideas left?

One thing to try is a "wrap" test to see if you can "echo" characters
back into the system.

Since you have the null modem cable, the easiest way to do this would
be to take a short piece of wire and plug it into pins 2 and 3 on one
end of the cable. That will short Transmit to Receive, and will
"wrap" the transmit signal back into the receive pin.

Plug the other end of the null modem cable into the ST and type on the
keyboard. You should see the characters you type echoing back on the
screen.

To verify the test, try it on the PC.

As long as you have flow control set to OFF or NONE, whatever you type
on the keyboard should be sent out the transmit pin, and then sent
back into the receive pin by the shorted pins 2 and 3 on the cable.

If it works on the PC, but not on the ST, it does indicate a problem.

(Be sure you have pins 2 and 3, not the ones at the other end of the connector. If it doesn't work right away, especially on the PC, try the second and third pins on the other end of the connector on the cable.)

If you have a voltmeter, try measuring the voltages coming from the STe's power supply. Generally the red wire should be +5 volts, and the yellow should be +12 volts.

The power supply can be another common failure point which can cause seemingly unrelated failures like you've been seeing.

Right... The ole loopback test.

Thanks to your suggestion, I've now tried that. Worked on the PC, but not on the ST.

Hmmm... Would the PS have anything to do with the serial port, floppy, or cause the video to go weird?

I'll have to borrow a multimeter from work and see what happens.

Thanks,

Yeah, could do as the serial port needs 12v for the line drivers I think,
or does that TL492 provide this as it needs to have 12v and -12v. Well
not sure, don't have the schematics of the ST to hand. However I'd check
the power with that mulitmeter. The caps on the PSU after lots of heat
can go bad and sort of crystalise and alos check joints at these caps.
They're the big high voltage ones, two of 'em. However also power of the
PSU and leave it for some time to let them discharge, or if you like to be
daring like me, get a well insulated screwdriver and put it across the
contacts. This doesn't do them too much good but a few times won't hurt :)

If there are parsers out there then this could be the first step to
convert GFA-sources to either C or 68k. If one could use a GFA->C
preprocessor then one could use GFA-basic on virtually any system out
there.

Actually, since using my girlfriends M$ computer, I have discovered many pages that won't allow IE to work. Other pages that just won't work.

Those pages with tricks usually link to other browsers.

Sorry to hear someone is upset that they can't get a page with M$ products. Unfortuneately on the internet, M$ is not so compassionate when the problem is reversed.

Lets just stick to standards.

I am always happy if it works with CAB;-).

I am happiest using Atari software myself.

However, I use Netscape on the Pentium when MS products fail to deliver, or are hampered by their own custom code.

Ended up with a nice little lst2gfa conversion tool, however since
it's based on a dis-assembly of the original editor, it's a mess
of undocumented asm code. It's a small step closer, the editor
is like 1meg of asm code, where as this tool is only 130k of
asm code.

Yes, exactly.

> I'm particularly interested in CPX modules as you don't have to worry
> about the limitation of 6 (I think) ACCessories.

You cannot do this with a CPX because a CPX won't be able to do the
timing, which is required. (I may not be completey right about this, but
basically my statement is correct. I thought about writing a CPX in
addition to my accessory a long time ago, but this is not possible.
There are several things that cannot be done by a CPX, this is one of
them.)

>Perhaps someone into programming could turn it into a CPX module as well
>as an ACCessory? It's only 77 lines long and the comments say it should
>work with SCSI and IDE drives.

I bet it will not work for ATAPI devices or the Milan. This may not be
relevant for but you can write software that is definitely
hardware-independent is by using the XHDI or SCSI Driver software
interfaces which are at least partially supported by the current (hard
disk) drivers for the Atari.

> By the way: what is actually the difference between the various harddisk
> drivers out there? How does the user notice any difference? Speed?

There are lots of differences. Speed is only one issue here. But you
also get a bunch of additional software for parking drives, ejecting
media, configuring drives, partitioning drives so that you can exchange
data between the Atari and PCs running Windows or Linux without
additional software and much more.
Just download the demo version of HDDRIVER or have a look at the website
(http://www.seimet.de/hddriver_english.html) and compare the features
with what you get with AHDI. You will notice a tremendous difference.

Hallvard Tangeraas wrote:

> I see. But there must be other solutions available which don't use
> "dirty" shortcuts.

Yes, namely those, that are based on XHDI or the SCSI Driver interface.
These solutions are clean and independent from the platform. They even
work on the Milan with a PCI SCSI card, because the driver for this card
supports the SCSI Driver interface.

> I must have misunderstood something here, because I thought XHDI was
> something to be installed on the machine and could then make these
> features available. Not so, as the package only included a .TTP file and
> loads of text files. Apparently something for programmers and not a mere
> user such as myself.

XHDI is a software interface that is a part of the hard disk drivers
CBHD, HuSHI and HDDRIVER. The TTP file and text files you are referring
to are some tools and the XHDI documentation. BTW, this is also what the
text files say ;-).

> I also found "SCSIDRV.TOS" at your site (can't remember if it was at
> your site or just linked from there), but this didn't help either. More
> of the same technical documentation etc.
> What's all of this?

That's the technical information of the SCSI Driver software interface
version 1.01, which is supported by HDDRIVER and the PCI SCSI driver for
the Milan. This software interface and/or the XHDI software interface
gives a software developer all he needs in order to access any SCSI (and
with HDDRIVER also ATPAPI and IDE) peripheral in a platform-independant
way. Otherwise the developer would have to write new code for each new
piece of hardware, e. g. PCI SCSI or IDE of the Milan. Have you ever
wondered why software like the SPIN! CD ROM driver runs on the Milan and
supports ATAPI and SCSI CD-ROM drives connected to the Milan even though
SPIN! was written before the Milan hardware was available? That's
because SPIN! uses XHDI and the SCSI Driver and is thus
hardware-independent. It will also run on new Atari clones (even though
in my opinion there won't be any), provided that a SCSI Driver will be
available for them.
Actually there is no magic in this, other computing platforms work this
way as well. All that's required is the low level driver (which is the
SCSI Driver) for your bus hardware.

It's quite bizarre that this /used/ to work, I only noticed this problem
after installing the latest version of HDDriver, but of course the problem
might have been caused by something else. Incidentally, I had to return to
this earlier version because of fatal system crashes when copying largish
(1MB or so) files from SCSI.

One of those mysteries I suppose!

1261. Help Identifying ST Game??

Newsgroup: comp.sys.atari.st
Date: 2001-07-01 14:30:20 UTC
From: Kevin Saturna <saturna@efn.org>
Message-ID: <9hnc5s$cg9$1@news.efn.org>
Source record: 44230

Atari Enthusiasts,

I'm thrilled to be able to join in here. About 13 years ago I used to love to use my friend's Atari ST whilst staying at his house in the country.

There were two games in particular I enjoyed playing, when not using the MIDI software.

One was Dungeon Master. That was easy to identify.

The next one I cannot for the life of me remember the name of. I'm hoping someone here can help!

The title/startup screen, it seems to me, showed some kind of vehicle and underneath was the title of the game, and the writing was large and appeared like metal with rivets in it.

The game play involved driving a lot down the highway and you buy all sorts of items to soup-up your vehicle. There were also parts where you would leave the vehicle and go inside buildings where you had a gun and would I think try to collect money and things. I think there were green blobs on the floor that you had to be sure not to touch and red or orange barrels.

The driving scenes I believe were vertical going from the bottom to the top.

That's about as much as I can remember.
Thanks for any help identifying this game!

Message-ID: <uGL%6.546$w24.795653@typhoon.columbus.rr.com>
Source record: 44191
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The time has come for me to admit that I'm not going to be able to make use of my Atari stuff anymore. I ran out of space to have it setup a long time ago and I am now running out of storage space.

I have a *lot* of ST and 8-bit hardware, software, and accessories. I've still sufficient fond memories of Atari to want to find a good home for it all and I'm looking for suggestions! I don't really have the patience or energy to sell it all on eBay. If I can't figure something else out, I intend to donate to a local charity (they'll put it in their perpetual garage sale to raise whatever they can). I'd prefer to know that it was going to be used than perhaps pitched in the dumpster if it doesn't sell.

Any ideas about good homes?

Rob

1268. Seagate 20Gb IDE

Newsgroup: comp.sys.atari.st
Date: 2001-07-01 21:22:47 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <9ho4b7v1@news5.svr.pol.co.uk>
Source record: 44151

I have just tried to fit a new Seagate IDE drive into my CT2B Falcon with no result!

It seems that 20Gb is too much for our ancient hardware?

I used HD Driver 8.02 to partition it with 20 odd 1Gb partitions, so far so good, but upon rebooting - nothing happened! No driver on the drive, so back to the floppy, no partitions existed! Tried again but this time I got false readings as to the capacity of the drive and corruption on the screen ensued.

So it was back to the Maxtor 2.1Gb.

The Seagate is the ST320413A model ULTRA ATA.

Any one has any ideas on fitting this? Or is it a case of fitting in the Pegasus when it arrives!?!

Neil :-(

1. Halward has valid email, so you could post the message to him personally.
Binary data, like image are not good thing on usenet.

2. If you still have original PSU unit, maybe it can be repaired. Maybe I
can help. If you want to use external one, I really recommend using PC's
unit over almost anything else. It's cheap, easily replaceable, very
powerfull and of quite good quality.

This is a suggestion, with question mark "?":
If you have different email accounts on your ST and PC, zip your source
and email to yourself on the other platform. No hardware expenses involved
:)

I'm about to try this myself, between a TT and a PMac.

YEMD,
Charles.

>has any ideas. I partitioned the drive into one big 3 gig partition.
>Could that be the problem?

Are the files you are trying to copy, or their partitions, using long
file names? Kobold pre V3.5 won't handle LFNs. Unfortunately 3.5 was
never ported to English and SySol/Atari Workshop didn't import it even
though I produced a translation; something about V4 coming 'soon' -
that was Autumn 99 and still no sign of it! German version should be
available from ASH.

Also, which hard disk driver are you using? And which OS? I don't know
about Linux, but according to *the* expert, Dr. Uwe Seimet, while
there is no upper limit to a drive's capacity, there is an upper limit
to the partition size: With TOS 1.00-1.02 = 256 MB, TOS 1.04-3.0 = 512
MB, TOS 4.x = 1 GB, MagiC and MiNT = 1 GB or 2 GB if disk formatted
DOS-compatible.

The Yamaha sound chip is soldered in, near the right rear on my
STFM and I think on STE too. Not too difficult to unsolder if you
have approriately small iron and a solder sucker or desoldering
braid. But are you sure you don't have a faulty floppy disk
controller (though your sound buzzing makes that unlikely)?

I blew the dust of and fired up my old STE for this, The first TUS upgrades would only work with Tos 2.06 later they introduced auto folder prgs driva, drivb and drivab that made it work with Tos 1.4 onward driva.prg placed in the auto folder without the HDcookie makes magic work, (well it does for mine) I only found this out a few years after installing the upgrade it is a tiny prog I can post it here or mail it to James who should pay more attention as the question arose on the Zetnet mailing list a couple of years ago where I also solved the problem

> Lyndon Amsdon
> --

The switchable clock signal to the floppy controller is not affected by
software
in any way, once the OS has requested a transfer DMA takes over, so your
choice of OS makes no difference to the real transfer mechanism.
However, the step rate (time to move the head from track to track) is
3ms for DD and 6ms for HD. TOS Below VER 2.0 had a default of 3ms
and above was set to 6.

If the step rate is set to 3ms for a HD access then the r/w head will loose
track position and the error will be reported. A simple test is to write a
small file
to a fresh HD disk and read it back, generally it will work fine.

The TUS_FDC.PGR program only sets the HD cookie and does
not trap any system calls, unlike TUS_DRVA ETC that trap a floppy access
and sets the step rate to 6.

I would suggest making sure that Magix is set for a step rate of 6 on the
drive
and all should be ok.

Dave

Mmm.... It doesn't look like the serial port is working all that great, or I would hook up my modem to it, run my old BBS program, connect to it with my PC, and D/L the needed files.

Oh well. Unless it's the power supply, I'll probably end up getting another ST. It's not likely I'll be doing any soldering with this box, even though some possible solutions have been provided.

Another question I asked earlier:

If I use my exisiting SCSI Hard Drive with a Falcon, would it be able to read the data?

> and where can we find out more about this new STOS game ?

Well, I'd love to give you screenshots and stuff, but... Well. the ST is hosed right now.

I stopped working on it around 1996. I had worked on a number of games, but this one was the closest to being finished. It has a built-in level editor, a built-in screen saver, optional keyboard, joystick or mouse controls, the ability to use .neo or .pi1 files for backgrounds, and random or contest modes. There (hopefully) will be 100 levels.

I could tell you what the game is like to play, but it's an idea I've yet to see anywhere, and I'd hate for it to get copied before I can release it! All I will say is that it is a puzzle game.

:-)

>
> One of those mysteries I suppose!

Not really. That's why I say on my web pages that I don't officially
support the Hades and the CT2. (Even though there are no known issues
with the Hades and HDDRIVER 8.) It's just that hardware extensions do
not make the Falcon a more stable machine. The problem you observe is
typical for a machine where the hardware is not working flawlessly
anymore due to a hardware extension.

Yes, exactly. But note that with MiNT and N.AES you can have more than 6
accessories.

> I don't know if it's just that SoftLink is so old and that memory
> management apparently wasn't that much thought of back then, or that the
> ACCessory grabs a lot of memory.

To me this sounds not as if the memory problem is caused by the hard
disk drivers. I guess SoftLink causes this. Hard disk drivers usually
only allocate memory once when they are started and they don't need a
lot of it.

> Would it be possible to build an auto power-down feature inside the
> HDdriver itself, and use the configuration program to set the time
> delay? Maybe the latest version already has this for all I know...

No, this is impossible. For such a feature some kind of timing is
required. In theory HDDRIVER could use one of the ST's timers for that.
In practice this would result in numerous incompatibilities because
other programs already rely on the timers being available for them (and
some timers are used by the operating system anyway). Accessories,
instead, use GEM for timing, which is non-critical.

>
> It seems that 20Gb is too much for our ancient hardware?

No, 20 GB is fine. There is no size limit for SCSI drives with the Atari
and the size limit for IDE drives depends on the hard disk driver. With
HDDRIVER IDE drives up to 128 GB are supported.

> I used HD Driver 8.02 to partition it with 20 odd 1Gb partitions, so far
> so good, but upon rebooting - nothing happened! No driver on the drive,
> so back to the floppy, no partitions existed! Tried again but this time I
> got false readings as to the capacity of the drive and corruption on the
> screen ensued.

The false readings are caused by a bug in HDDRUTIL that has already been
fixed with the current version 8.03. This bug is only relevant when
partitioning with a large number of partitions, as you did.
It is possible that your problems with partitioning in general will be
solved with the updated driver version. From my database I see that you
are a registered user. I will send you the update by e-mail. Please tell
me whether this helped.

Which conversion program? Maybe I have missed something here. But
anyway, how could you load the CPU too much? The CPU is always running
with the same (full) speed. And it does multitasking all the time (due
to interrupts).

I have a legitimate copy of Computerinsel's HP scanner driver if you want it for free. The GDPS-friendly driver worked well with my ScanJet 4p, which is now attached to my Mac. The master disk says v1.16, but I remember getting an update from Homa Systems sometime later on.

My TT's monitor went up in smoke a few weeks ago so I can't access it at the moment. I have backups of the hard drive on CD: I'll try and dig up the last installed version of the driver. My TT's scanning days are over, so there's no need for the software anymore -- I'd rather see it in the hands of someone who will use it. Contact me via e-mail (remove the 'invalid' of course) and I'll send it your way.

Registering is required for those are not yet registered with me and did
not get HDDRIVER directly from me. Usually registering is done with
ordering an update because non-registered users have to send me their
original driver disk anyway for updating and/or registering.
A general note: The original floppy disk is the only proof that you have
a legal copy. BTW, it is said but I observe that there is an increasing
number of users that do not use legal copies. Some of them even call me
for support. Of course this is not the way it should be and it will
definitely not have a positive effect on the future of HDDRIVER.

Hi Uwe,

I got 2 registration questions. (1) I ordered V8.03 from atari workshop uk (for the english manual), I guess this means I should send a registration form to you anyways? Also My father (yet another atari user) has HDDriver v4.61 (I think) that he got used from another user. It has a legit disk but the manual is gone, if he were to send the disk and pay for upgrade could he also order an english manual? or could he get the manual from atari workshop uk?

Anybody who has ordered HDDRIVER 8 from Atari Workshop is automatically
registered with me. Starting with HDDRIVER 8 those drivers floppy disks
distributed by Atari Workshop already have one of my labels with my
serial number on it. You are already in my user database and no further
registration is necessary.
As far as your father is concerned, as long as he has the original
driver disk (assuming that this disk is actually a legal copy, which I
can check when I get the disk or when the disk is sent to Atari Workshop
for an update), he can order an update including a new (English) manual
from Atari Workshop. Any user can get a software update from me, but
English manuals are exclusively available from Atari Workshop. I only
distribute HDDRIVER with a German manual. BTW, all these language issues
are only relevant for the manual and the README file on the driver disk.
The software is identical. There are no separate German and English
versions of HDDRIVER and its tools. All programs are bilingual. This has
several benefits and in particular it guarantees that at the same time
as a new German version of HDDRIVER is released, it will also be
released in an English version. So in contrast to some other software
English releases of HDDRIVER don't lag behind.
Note that the update from Atari Workshop may be a little more expensive
than when you order it directly from me. But this is perfectly fine
because Atari Workshop has to be compensated for their support overhead,
and in particular for translating the manual and the README.

1300. CAF problem

Newsgroup: comp.sys.atari.st
Date: 2001-07-02 17:20:16 UTC
From: rking@zetnet.co.uk
Message-ID: <3b40ad50$0$13978@news.zetnet.co.uk>
Source record: 44170

Hi All, question on behalf of my son:

using CAF on a C-Lab MkX, he was composing a one audio track and 14 midi track tune, when the whole arrange window suddenly became compressed leaving the midi track parts, about 3mm on screen. Nothing had gone wrong with the midi content, each track portion expanding on double clicking to show the normal content and the tune played perfectly. However the compressed screen made it impossible to sync anymore tracks. Any ideas??

Thanks in advance,

Bob

I did find an odd problem when copying large file between a SCSI CD rom
and SCSI HD. Not sure if HDDRiver was causing it (v7.8 I think) but I got
a system stack overflow, as if HDDriver wasn't setting up the stack space
right. I'm not sure what went on but it froze the system (plain TOS 4.04
with no accelerators, clock patch etc). I was trying to copy a whole cD
to a second hand HD to test if it was OK, but I guessed this was software
issue.

Hard disk drivers do not set up the stack space like ordinary programs.
This is because when they are booted other memory management rules apply
than later, when the complete system has been initialised.
The way HDDRIVER reserves stack space is the same as it is done by most
other hard disk drivers, notably AHDI, and is has not changed since the
first version of HDDRIVER, which was released more than 10 years ago.
This is why I don't think the problem you observed is related to
HDDRIVER. In 10 years others would also have found something wrong.
Anyway, what I suggest is that you give more details, in particular on
the program you were using for copying the CD (Kobold, plain GEM
desktop?) or whether it was an audio or data CD. If the crash can be
reproduced installing SCSI_MON in theory would give details on the SCSI
operation that was executed. I say in theory because in practice logging
the activity of HDDRIVER with SCSI_MON requires HDDRIVER 8. But for
HDDRIVER 8 (and also for CBHD) SCSI_MON is a valuable tool for analysing
SCSI commands that are issued using the SCSI Driver. (With HDDRIVER you
can also analyse IDE and ATAPI activity this way.)
Actually your error description sounds like something was wrong with the
program copying the files.

>DOS-compatible.

This has been tried under Magic mostly. I do not think it is that.
Kobold seems to be the culprit.

Which OS are you using. Twlight is the screensaver that I use under
TOS, Geneva and Magic. When you call up the accessary there is a
setting called "Schonen nach:". Click on the box to the right of this
name and you will see some settings for time. Under that is another box
for the configuration you want to set active. You can choose various
screensavers and give that cfg a name. When you are done click on
"Sichern" and that will save the settings. If this does not work, email
me and I help you further.

Slip of the mind/fingers - the 'program' is surplus (should have
been just conversion, or its effect). I am not a programmer, but
even if there are interrupts to handle housekeeping, I would have
expected that it is possible to so overload the CPU with them
that it ceases to function correctly for other tasks. Or is this
just a flight of my imagination? On second thoughts, since all the
conversion does it to double the clock speed to the FDC, it seems
unlikely to affect the CPU.

If you have FCopy, there are facilties to change the steprate in
that (click on the 'More' button). IIRC, because the clock is
doubled for HDs you have to up the steprate from 3 to 6 ms,
which will produce 3 ms actual timing, IYSWIM.

I will give it another go but this particular time I was coping a data CD
with Spin (ahh maybe this was messing up?) and just draged all the SCSI CD
contents onto my SCSI drive.

I'm infact thinking about upgrading from my version of 7.8 and getting the
update from you so to register at the same time. I don't really need a
printed manual as I have one from 7.12 and I've been using it for some
time and it's pretty simplistic.

>Actually your error description sounds like something was wrong with the
>program copying the files.

GEM copying isn't the best I guess (certainly not for speed) but I thought
it should be fairly reliable. I'll have another go.

>
>Hmmm... Would the PS have anything to do with the serial port, floppy, or cause the
>video to go weird?
>

Yes... a low voltage can cause erratic, random failures, a missing
voltage can cause systems to fail (the 12volt supply runs the floppy
motor and the RS-232 signaling for the serial port).

>I'll have to borrow a multimeter from work and see what happens.

If the multimeter you get has a sensitive AC voltage range, try this:

Measure the **AC** voltage on the lowest range across the **DC**
power supply leads.

That is, measure from the +5v lead to ground, and from the +12v
lead to ground.

If all is well, you should see very close to ZERO volts AC across
the power supply.

If you see any appreciable amount of AC voltage in the supply, it
means the filter capacitors in the Power Supply are failing, and
allowing AC ripple voltage to pass through. Usually this condition
is also coupled with an abnormally low DC voltage.

(If you had a scope, you could actually see the AC voltage, if any is
present.)

As was mentioned earlier, this is a "normal" part of the natural aging
process of electrolytic capacitors, and is one of the most common
causes of power supply failure.

And, it could be causing all the other symptoms too..!

Hi Derryck,
I have'nt gotten to try Hddriver again yet (have ver. 7).
You might be talking about Fastboot by Tommy Jonaeson. It bypasses the
memory check and search for an IDE (not sure if it works with Magic).
Thanks for the info.

Body handling: HTML body converted to readable text

Thanks for the suggestions folks!
Unfortunately none of those games is the one.

I'll try to scrape up a better description from my brain...

Title Screen: Full screen image of a vehicle positioned as if it's driving off the screen right into your face. I believe the vehicle was a reddish color and looked like something out of Mad Max. Underneath the vehicle was the title of the game. The letters were grey/metallic in color, very blocky and the effect was further enhanced with rivets in the letters.

Game play: You drove your vehicle around on a road, a straight down overhead view. You could pull into gas stations and go to stores. Inside the store you'd purchase mods and weapons for your vehicle. The guy would speak to you with cartoon-like white bubbles with the text in it.. I think. Inside the warehouses, the rooms were basically just black screens with various items sitting there. They were outlined with gaps representing doors. There were green blobs on the floor, I think you were supposed to avoid them. There were metal barrels that may have had gas you collected for your vehicle in them. You ran around with a gun so there must have been enemies. I think the point was to get gas an money. But there may have been missions of some kind involved.

Okay, it's been probably 10 years since I saw/played this. My memory is obviously going to be fairly skewed. That's the best I can recall. I sure hope someone knows what this is because there's little chance of me finding my old friend and asking him.

Thanks for all attempts at help!

1323. Tunesmith Article published in MyAtari !

Newsgroup: comp.sys.atari.st
Date: 2001-07-03 07:20:59 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0107022320.6696fb25@posting.google.com>
Source record: 44192

Hello All

Finally got my article published on the "Matrix Keyboard Tunesmith Instruments" (What a title..ear catching isn't it! :-)

This article should clarify the concepts I was trying to get across. They did an excellent job formatting it. It also includes FILES, like the actual program: Tunesmith, as well as my Matrix keyboard scales library.

Go here:

http://www.myatari.net/june2001/matrix.htm

and you can see an ugly pic of me with Tunesmith in the backgrd as well :-)

I would encourage anyone here to write an article for My Atari...its an outlet for us. It can be technical as well, so if you have any tips about ANYTHING ATARI or even have a great pic of your Atari setup,
they would welcome it. Go to :

http://www.myatari.net and click on CONTRIBUTIONS for info on how you can do your part for the Atari Community via your submissions.Lets all pitch in and make this OUR magizine ! It's your opportunity to make a differance.

In the meantime, please read the article and tell me if you understand it or not! :-)

You should try to find what Auto folder or (if you run a multitasking OS)
parallel running program is interfering. In my case APPLINE was the
culprit, and since it's a commonly used utility...

You should instead look for Bubbles, this one will work and will also work
with AfterDawn modules.

No, it's not that one.

I'm hoping that someone will pop up here with the right name and a URL,
alternatively there might be a link from the MagiC Online pages (possibly in
the hints page??)

I scooted the patch off my drive when I installed an IDE drive in my Falcon -
basically you just dragged the magic.ram file to a TTP.

Hi Claes,

Thanks for the info. Steven, like all musicians :) is not out of bed
right now (10.30), but I'll tell him the good news tonight.

Cheers, from baking (82F) Wales.

Bob.

A good home. I don't know. But you can probably give the stuff
away, as opposed to putting in trash.
It would maybe sell, if you put a description of what you have, maybe
someone would offer.
E-Bay or other auction has stopped the auctions that used to occur
within this group. Thanks for that.
I'm a bad example, but I offered up my ST stuff here for free and
got several takers. They had to come and pick it up, I certainly
wasn't going to ship it.
If you have a few really juicy items, you might want to try to sell them.
I don't like selling over internet. Risk of too many things happening,
buyer not paying, buyer not satisfied with what he got, shipping, etc.
Russg

1331. Who knows about Holger Herzog ?

Hello,

I would like to know wether anyone knows Holger Herzog who is the 'Project Manager' of faceVALUE. His website (RUN!Software)
is still available but I can't get any answer of him by mail. That makes me a bit anxious... faceVALUE is now about v3.2 beta
and I'm a beta-tester... Does someone have news from Holger for me ?

Regards

Mathieu

I used 7.80 perfektly on CT2 Falcon.
One (huge) ;) IDE device and 7 SCSI devices.

It workï¿½s NOT on original 64MB Conner IDE!
(Also not on 450MB Hitachi device)

In CT2 normal mode yes, but NOT in turbo mode.

If i used the conner, magiC (patched) wonï¿½t boot and some SCSI devices
doasnï¿½t respont also.

ATA4 IDE devices are perfectly :)

I don't think so as bugs like this would have been found fast also by
other users. Anyway, version 7.8 is history, so it's hard to make any
guesses.

Hi Bill,
I must admit that i don't know a thing about magic. However if the
standard bios calling convention is used then using the driver software
for tos versions below 2 would work o.k. as the step rate would be set
accordingley for the correct drive.

Cross-posted to: alt.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.classic

I will trade Bounty Bob, label normal used condition, no tears or edgewear, only very minimal glue spotting.

I will trade for any of the following ORIGINAL game carts (no copies!):

Tapper
Pharoas Curse
Zeppelin
Matterhorn

Not interested in any other trades at this time so please e-mail me only if you want to trade one of these games on my list for Bounty Bob.
Thanks. -Satcom2

Hi Peter,
Even though the floppy clock is doubled it makes no difference
to the step rate sent by the floppy controller to the drive. The actuall
drive
(for some strange reason) requires 6ms in HD mode.

I searched and found the authors, sent them money and got the program.
Then a year later, it came out as freeware. That is ok though. I
believe the authors did not think the program was well-liked by people.
I just about begged for a copy. Mine is in German, but I can still use
it effectively. I heard the authors all went out to dinner on the money
I sent them ($50). Kind of made me feel good.

This was probably solved last week, but here goes...

I'd boot from floppy, run a hard disk driver from floppy to acces the drive, the take out any potential conflicts with TOS-fixing softwrae that's no longer applicable with Magic.

Add things back to the Auto folder or accessory directory until the culprit makes itself known.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 07/04/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $5.15 shipping, due to
weight, counts as 1st item
$ 4.00 Death Sword (Epyx)
$ 4.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 4.00 Final Assault (Epyx)
$ 4.00 GFL Championship Football (Gamestar)
$ 4.00 Keith Van Eron's Pro Soccer (Microplay)
$ 4.00 Lands of Havoc (Antic Software)
$ 4.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.00 Metro Cross (U.S. Gold / Epyx)
$ 4.00 Paint Pro (Abacus Software)
$ 4.00 Quadralien (Spinnaker)
$ 4.00 Renegade (Taito)
$ 4.00 SwiftaR (Accustar)
$ 4.00 Techno Cop (U.S. Gold / Epyx)

$ 4.00 Warship (Strategic Simulations, Inc.)
$ 4.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 4.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 4.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 4.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 4.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 4.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 9.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.15 shipping, due to weight, counts as 1st item

$ 9.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 9.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 9.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 9.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 9.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 9.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.15
shipping, due to weight, counts as 1st item

$ 9.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.20 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

1366. New version of M now Available !

Newsgroup: comp.sys.atari.st
Date: 2001-07-04 08:11:46 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0107040011.6cea8cb7@posting.google.com>
Source record: 44137

New version of M available

I am happy to announce that we now have a new version of M, the interactive performing Algo-comp application.(by Eric Ameres and David Z) The previous version was a "cracked" copy that the programmers still gave thier consent for a download. However, Phillip Louie (of the Atari-Midi mailing List) was able to supply us with a unprotected "legal" copy of M. It is now on my site. See link below. This version works well in Steem as well as a Falcon and TT with no crashes (yet!)So good news for Atari-Midists!

Link: http://sites.netscape.net/timconrardy/m.htm

Anybody use M?

Tim Conrardy

John's problem starts before the Auto folder is executed, just after the warm boot that the MagiC loader executes in order to load the magic.ram file.

The current best guess is the use of an ICD boot partition that isn't ahdi-compatible.

1372. Installing TOS 2.06 in a 1040 STE/4

Newsgroup: comp.sys.atari.st
Date: 2001-07-04 10:41:15 UTC
From: Ove Peter <ovepeter@gmx.de>
Message-ID: <3B42F2C9.C21EE3A@gmx.de>
Source record: 44139

Hi all,
I hope you can help me with a problem...

I am trying to install a TOS 2.06 in my 1040 STE, 4Megs.

The TOS is on two Rom chips, just like the old 1.60, but is 2 pins longer than the old (the sockets in my Atari do have that extra 2 pins, though, so installing physically is no problem).

Now, the problem is, when booting the 1040, the screen appears with a black block in the upper left corner where normally the Atari logo would appear. After that, before counting memory or doing anything, it bombs out with 3 Bombs and restarts instantly. Which results in an infinitive loop of course. I have bought TOS 2.06 two times to fit my other 1040 too, and the problem appaers with both the 1040 and both TOS 2.06 I have.

Am I missing sth? I think it is possible to install 2.06 in an 1040 STE? Anybody seen this before?

Thanks for answers,
Ove

Hmm

you should be able to just switch the chips over without problems!
Nothing else is really needed.

I'd check that other ic's in the computer haven't come loose, this does
happen. If it does the same after replacing the original TOS chips then
this is likely to be the cause.

Why not offer it all to anyone in this newsgroup who is happy to come
and collect it and who will make a donation to your local charity
while they're doing it? I live in the UK otherwise that's exactly what
I'd offer to doï¿½ I can understand your not wanting to get into
negotiating on prices for odd bits of hard and software but surely
some dedicated Atarian would like to take the lot off your hands? I
would!

No need to blow smoke up someone's ass who already has a cloud to spare on
his nice 8 bit stuff.

Satc- where do you get all these sweet 8-bitties? You've had some other
titles for trade that are pretty neat. Too bad I never have anything on the
menu.

Hello,

We now have a "language" system on Atari-Users.Net . To select a language interface just click on the flag of your selected language in the box on the lower left. The system DOES NOT translate all of the text. Just certain options. Could some of our fellow German, French, Spanish, Danish, Italian and Czech Atari Users, that also read English, check the system for us?

IF possible.. could you also translate our "Main Menu" into German, French, Spanish, Danish, Italian and Czech language?

In time we will upgrade the Main menu also into the Language system.

Just wondering.. would any of you be interested in a multi-language version of Atari-Users.Net? Would you help operate that version? Translate post to and from your native language? (example - French "editor" translate an English post into French.. when needed.. translate French post into English.)

Thanks for your help!!!!
Rob

He should also check that all the pins of he PROMs have gone into
their sockets properly. I had a problem with my upgrade some years
back - it worked only intemittently. On checking I found a couple
of pins had *not* gone into the socket but had been bent inwards,
though making intermittent contact. Removing them, straightening
out the legs and reinserting more carefully did the trick!

Regards, /Peter/

1384. CAB 1.5 problems

Newsgroup: comp.sys.atari.st
Date: 2001-07-04 21:49:06 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <9i030i$ah7$1@plutonium.compulink.co.uk>
Source record: 44048
Body handling: HTML body converted to readable text

A friend of mine uses an STFM1040 with TOS 1.02 and CAB 1.5,
normally with a hi rez monitor. He needed to give a demo on a TV
via SCART, but luckily came to me first to try it out. I found
that while his setup worked fine on hi rez, when I tried it on the
TV in both med and low rez CAB started to load but stuck during
the small 'Loading xxx' dialog each time. Only after using the
Sebra hi-rez emulator did it work properly. (He is using GDOS 1.1
and some PD fonts, but I think that's irrelevant.)

Is this a problem with CAB 1.5 and/or TOS 1.02? My 2.7 works fine
in all 3 ST resolutions and higher, but then I use MagiC.

Another thing: His HTM file didn't display properly for some
reason. The first para was in small type despite an
header.
The problem seemed to be due to having after the header a command
. This format seems to be standard HTML. When
I split the angle brackets as it worked
fine. Any ideas?

Regards, /Peter/

OK! I found the problem and a big thanks to all who contributed their suggestions. I forgot about the floppy! I though I was running vanilla but Fastboot which bypasses the memory check and IDE search was on the floppy's boot sector. A blank disk did the trick. Running Hddriver helped with the message "memory block distroyed by user program" (thanks Uwe). Now on to why I can't change resolutions without crashing (for another thread and after I re-read the manual).
Again, thanks all.
John G.

Note that this message is displayed by MagiC, not by HDDRIVER. Anyway,
fine that it works now.

1394. Jinnee 2.5 crashes frequently

Newsgroup: comp.sys.atari.st
Date: 2001-07-05 12:46:55 UTC
From: alex.stepney@bluewave.com
Message-ID: <e344ade0.0107050446.37548e46@posting.google.com>
Source record: 44063

All,

I mainly use my Falcon with CAF for music production. I fancied an alternative desktop to aid me in general admin tasks, backing up MIDI files etc. So I bought a copy of Jinne v2.5 and it has all the features I'm looking for in a desktop, only problem is it bombs out fairly often or freezes or drops back to the GEM desktop..... I don't get this problem with any other program.

My machine has the following spec 68030, 14MB, 6GB IDE, 1 GB SCSI, Yamaha 4260 CDRW, ZIP 250, TOS 4.04, HD Driver 7.8, NVDI 4.x.

Does anyone run Jinnee with plain TOS? is it that stable? or should I get MagiC and use that for my admin tasks and boot Cubase with single TOS? Will Sound Pools CD writer run under MagiC as I use this to burn my tracks to CD?

Cheers,

Alex.

I agree. Don't waste your time. (And no, Andre, I've never catalogued
my disk software:-)

> > Pharoas Curse
> > Zeppelin

These and other Synapse titles are on the cart lists. Apparently they
were included on the basis of Synapse announcements and the fact that
there are cart size (16K) versions of the games. I once spoke to a
programmer of some of those games and he did not think carts were ever
issued.

> > Matterhorn
Digital Press lists as NR

> > Tapper
Thousands have looked and none have found? Sega listed it in the
instuctions for other games. Also, its catalogue number is lower than
Super Zaxxon, so it logically should have come out. I think its
probably only disk or cassette.

1398. ST Magazine Cover Disk Snapshots

Newsgroup: comp.sys.atari.st
Date: 2001-07-05 19:40:26 UTC
From: Jonathan Kay <Jonathan@kay026.freeserve.co.uk>
Message-ID: <9i2g34ncl1@news5.svr.pol.co.uk>
Source record: 44068

Can someone tell me if there is a site where I can download snapshots of ST Magazine cover disks (e.g ST Format, Atari ST Review, etc).

Thanks for any help

Yes, but I just thought the authors deserved it. Besides, Twilight is
the best screensaver I have seen and works great.

Sounds like it is a problem with 1.5. I would look and see just the
settings are setup. It may be that what is contained in the settings
makes it incompatible with low or medium rez. I know when I used 1.5 I
was able to get it to run in medium rez, but I found high rez was better.

Jinnee was made especially for Magic and that is what I use it with. I
use EASE with Geneva and Plain TOS. It sounds like you may want to look
at the settings of Jinnee. I have version 1.0 and have not as yet
experience your problem. The best thing to do is get on the Jinnee
website and contact the author. He has helped me out many times.

U can also try Thing. Thing is only real competiton to Jinnee, full of
features etc. And works nice with any OS, so no prob on single TOS.

A wild guess...
I think that because you are using GDOS and not NVDI (vector fonts)
you will need to install some low and medium rez screen fonts.
Its a long time since I used GDOS so I could be wrong.

Hi all,
Running Magic 6 on a Falcon. It seems I've lost the ability to run
certain programs like BackloadIII. I assume it has something to do with
Backload re-booting. Also, Apex Viewers (not the main program) are not
showing pics taken with my Sony camera (it worked with TOS 4.04).
Apex is showing older pics from the Bird of Prey CD ROM though. I've tried
everything in the Magic config cpx, Install App. and the Magiccfg prg.
but no go! Anyone know if I've missed something?

1422. GT9500 Scanner not initialising?

Newsgroup: comp.sys.atari.st
Date: 2001-07-07 07:40:43 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <9i6edrfku1@newsg1.svr.pol.co.uk>
Source record: 44095

After finally taking the plunge into the scanning world it seems that it will be a struggle to scan my first document!

I purchased an Epson GT9500 scanner from a Warehouse operation in Stockport who were selling them in new condition, but without original packaging. The scanner arrived safely via courier, but it seems that the carriage wasn't in the locked position because I could hear it moving in the box (does this matter?).

To test it, I disconnected the SCSI lead from the back of the CDRW and selected ID 5 on the back of the GT9500 and powered up the scanner as per the manual. It seemed to go alright. I next tried it with the Falcon with MagiC loaded - started up the copy of GTLook2 (from the Belgian FTP site) and selected "SCSI extern" from boxes. Almost immediately after clicking OK I got an error message saying "Initialisation error" - Scanner not connected (Try Again or Cancel). I knew this was twaddle because I had done a SCSI scan with HDDRUTIL and it had picked it up no problem.

Can anyone suggest anything? I tried in TOS mode but still the same message. I am using a Falcon CT2B with either TOS 7.04 or MagiC 6.01.

Any help appreciated - before I consult the vendor!!

Neil :-(

> Jawbreaker II (Sierra)
> Star Maze (Roklan)

These six carts above definitively exist, but are very rare and usually you have to pay a lot of money to get them (I'm sure Gene can confirm that ;). Maybe 'Capture the Flag' exists also, but it's rather unlikely. You can add Roklan's 'Rack 'em up' as existant also (seen on epay).

Btw.: Does somebody know why the First Star titles are that rare? I have no explanation for that, because the game are excellent. Limited release? High retail price? Error-prone hardware? Released during the big videogame-crash?

I'll trade my mint dreamcast (controller, box & docs. included), 200 block memory card, sega rally racing, flag to flag racing, blue stinger, NFL2K and crazy taxi for the following:

Jaguar unit w/controller & all hookups
Atari Karts
Breakout 2000
Defender 2000
Kasumi Ninja
NBA JAM
flight for life
I-war
missile command 3D
powerdrive rally
raiden
super burnout
troy aikman
ultra vortek
val d'isere skiing
supercross 3D
and possibly any other interesting games.

The Eclipse doesn't support bus arbitration, so if the Dessee-card will
work without this it could work on the Eclipse PCI-bus.

They really should have locked it. The GT scanners are nice.

>Can anyone suggest anything? I tried in TOS mode but still the same
>message. I am using a Falcon CT2B with either TOS 7.04 or MagiC 6.01.

It should work! When I changed hard drives I downloaded the version off
the Chestnut Computer club instead of copying the version off my old HD.
I got the same problem and I eve took the scanner apart to reseat chips
etc. I then realised somehow (haven't a clue where) but picked up a newer
version that works fine.

Hello All,

My Jaz drive starting acting up last night. I cannot get it to copy files correctly. It will read files on the carts and even delete them, but it will not copy large files to the carts only small ones (50k or less). If I try to copy large files I get a message saying the data on the cart may be damaged. Anyone have an idea as to what the problem is? Is the drive dead?

No, he had the bitmap screen fonts in all resolutions on the disk,
I believe (I no longer have his disk). In any case, I wouldn't
think this could have led to the computer freezing on the first
'Loading xxx' dialog, as these use the system font.

> http://www.atari-users.net

That is an excellent poll. I would hope a significant fund could be developed to entice programmers to get our web browsers backup to speed.

I still think CAB is very good. It just needs to be revised, updated, and improved.

Its not like other atari browsers haven't been developed, it is that they haven't succeeded in creating a better all around product then CAB.

People know the weaknesses in CAB and what I think we really are looking for is a BETTER CAB. Perhaps a total rewrite is in order, but I would hate to see someone trying to create a newer browser from scratch only to come up short or abandon the project.

On the other hand, this could inspire a few new developements and multiple browsers. And with competition comes inovation (if not profits in the atari world;-).

Anyways, I can respond to this poll much easier than a poll on Computer chips that I have no ideas as to their capability and compatibility.

We know what people want.

A modern browser.

later Brian.

Well I found out the problem. I had hooked up an external 3gig SCSI drive that I am going to use for Linux. I used the same cable that I am using for my scanner. But when I hooked up the drive I forgot to hook up the terminator. The system worked fine for about a week and then last night all hell broke loosed. I should have realized something was wrong when my SCSI CD drive stop working. Now things are all fine. I feel stupid, but that is way things go. Now I just have to get Linux working.

Get the files off it and partition it or even format it as I had a problem
with one of my zip carts. I left it far to long and ended up losing all
my website that I created on it :)

Thanks Guys.. but the credit for the poll should really go to Lonny Pursell. If it wasn't his idea for the GFA Challenge.. I wouldn't have thought about it, like a few others who had the same idea too!

Thanks to the people who have voted so far.. at 30 votes.. if it was true pledge.. it would be almost $1000! The AUN polls usally get 100 votes.. I can't wait to see the final tally.

But please.. be honest vote only once, we need a really a good idea of what would be pledged! Also, leave a comment on what you want to see in a browser. I know what I want to see... at first one that is at least as good as Cab 2.8 but faster! And maybe Javascript support for 030 or better computers. Freeware and open source is a must! That way future development would be possible.

Also.. could some of our fellow atari users post the poll announcment in the other langauge site/newsgroups? The more the better!

Bengy.. thanks for posting it on Magic Online!

I cannot take full credit, without the people who made pledges
then my idea would of went no where fast. Initially when the idea
came to me I asked a fellow GFA coder his opinion. Yo GokMase! :-)
At first I thought it was a silly idea, but much to my suprise
it got results.

If this can be successfully applied to some other project
then I'm all for it. I'm amazed by the poll results already.

Thanks all those who have responded so far!

The situation has changed somewhat, I can now get the scanner working!!

I downloaded a copy of GTLook2 from Derryck's site it seems to be much different to the one I had from somewhere else. The version number is 1.05 (9/2/93) it seems to be a Dealer version.

BUT not working on the SCSI bus, I tried the parallel port in desperation and it worked first time. Each time a tried the SCSI ports (either of them on the back of the scanner) termination switched ON, ID set to 5 - HD Driver's useful device scan picked up that there was an Epson Scanner on ID5. But somehow GTLook2 wasn't getting that information!?

When do you switch ON your scanners? I was following the Epson manual which advised that it should be switched on before the computer and everything else. Would it really matter?

Does anyone have any ideas as to why it doesn't work on the SCSI bus?

Neil :)

|the manual. It seemed to go alright. I next tried it with the Falcon
|with MagiC loaded - started up the copy of GTLook2 (from the Belgian FTP
|site) and selected "SCSI extern" from boxes. Almost immediately after
|clicking OK I got an error message saying "Initialisation error" - Scanner
|not connected (Try Again or Cancel). I knew this was twaddle because I
|had done a SCSI scan with HDDRUTIL and it had picked it up no problem.

|Can anyone suggest anything? I tried in TOS mode but still the same
|message. I am using a Falcon CT2B with either TOS 7.04 or MagiC 6.01.

I recently aquired the same scanner and had exactly the same problem!
I found that if you selected "SCSI intern" and then on "OK" then it
initialised the scanner. Now I can't remember if I then had to reboot
or whether went straight to "SCSI extern" but it seemed to do the trick.

Mark.

>ID5. But somehow GTLook2 wasn't getting that information!?

Oh yeah, I remember now, the version from Derrycks site doesn't work on
SCSI as I previously said but I also got it working on parallel. However,
I would imagine this is for Falcon owners only (as it has a couple more
control lines) so there is no chance for ppl with STs to use a parallel GT
scanner without extra hardware. But my version of GT Look does work with
SCSI port and I assume parallel so I'm not sure where the hell my version
came from! Don't worry, your scanner sounds just like how mine operated.
I didn't want to use parallel as the GT doesn't have thru port and I don't
even know if everything supports a printer and scanner on parallel.

Good day all. We are currently seeking a reliable source that can reference for us as to who actually owns the rights to the Atari TOS. We have tried to contact Milan with no avail, and we are wondering if anyone in this UseNet group may have accurate information on this matter.

We are interested in making Atari TOS available on our Torro multimedia system series that will be debuting this fall, and we would need to negotiate with the actual owners of the operating system. If anyone has information on this matter, please e-mail, write, or call Merlancia Industries at:

You can switch the memory check off with BOOTCONF
(http://www.seimet.de/atari_english.html). Note that the memory check
has nothing to do with MagiC but is done by TOS before MagiC is loaded.

Sounds like there is a hardware problem, indeed. You probably get more
details when checking the last SCSI error message reported by the drive
with HDDRCONF.CPX.

Success does not mean that some people say they will give money for such a project. (You can expect some of them not giving any money at all even if they say so.) It is required that people are interested in (and capable of) writing the software. In my opinion new software for the Atari is missing because there are hardly any developers left, there is not much interest in the platform anymore and there are no decent programming tools, in particular for faster machines like the Milan. $1000 or even more will not change this.

Uwe,

True, some people will pledge and not pay up at the end. But I personally think it is still worth taking a chance on. If we don't try something.. we will never know. The idea worked for the GFA Challenge, why not this also? I believe most of the pledges came through, but Lonny is the one to answer that for me.

I would suggest that next time you word your supposed question something
like.

Are these programs freely distributable? Have TUS released them as PD.
If so etc,etc,etc

The way that you worded your supposed question gives me a different
impression.

Its really easy to do this from the top of the board, heat the device
and pull in gently free, or desolder with braid.
If they are resistors its ok to replace them with links if they are
damaged during the process (unlikely though).

Of course I agree with you Rob. There is more interest than what Uwe
believes exists. The problem is that people do not exactly speak up
they own an Atari. Take my area, we only have 8 people in the Atari
club, but I person know 10 more who own Atari computers, but choose not
to be members of the club. Also, I am the only one who gets on the
UserNets in the Atari-related areas. Yes, it is worth a shot. We need
to show programmers that there is still interest.

Hello,

Yes I did that and it did not work. I did fix the problem. I had gotten
a new external 3gig drive that I was going to install Linux on. I
connected it up and disconnected my scanner. It went fine for about a
week and then this happened. After a long while I realized that when I
disconnected the scanner I forgot to take off the terminator. Once I
hooked that up to the external drive as well, things were fine. I know,
call me stupid. We live and learn....

Hi Madmax

>> http://www.atari-users.net

>That is an excellent poll. I would hope a significant fund could be
>developed to entice programmers to get our web browsers backup to
>speed.

We seem to have forgoten the reason why our platform is all but dead in
the water now.

Developers have buggered off because there is no money to be made here,
the ones that are left are considering their position daily.

The only decent software appearing for this platform is short-lived,
unsupported shareware or freeware from people doing college courses in
programming who then disappear to program for windows platforms.

Many of our decent software arose from german college courses, theyve
now graduated and support for that piece has died.

A major inovation such as a new browser isnt going to happen, because
when it comes to near production no-one will dip into their wallets,
lets get real guys.

Yes, this is no problem. Note, however, that usually this makes no
sense. Compared with the TT's real SCSI bus the ACSI bus has only
disadvantages (less compatible, slower, even more limited cable length,
...) and not any advantage. Also note that the ACSI bus of a lot of TT's
has hardware bugs that lead to transfer errors when fast SCSI devices
(any current hard disk is fast considering the transfer rates of
TT/Falcon SCSI) are connected to it.

You may have 8 or more people in the club, but probably no programmers.
That's really a problem.
You cannot earn money by writing software for the Atari anymore and
that's one of the reasons why there is hardly any new software.
Programmers interested in earning money have changed the platform quite
some time ago and won't come back. If the others, who are writing
programs for fun in the first place and not for money, have no interest
in writing a browser (otherwise they would have done so), you will not
"force" them by promises of money to do so. Simply because it's not
money what counts for them.
It's in a way like trying to give a Linux programmer money to stop
writing software for Linux but start writing software for Windows.
Usually this will not work.

You can, but then again the ACSI bus is both slower and less complete than the SCSI bus. Also, the ADSCSI most definitely does not work with newer SCSI drives that require parity; you would need the Link 97 for that. The maximum cable lenght on the ACSI bus is also limiting.

Anyhow, unless you have devices that only work with ACSI (e.g. Laser printer, BioDMA Ethernet adapter, etc.), you are better off using the SCSI bus.

I wrote a reply as below when i received your email, unfortunatley
i wasn't logged onto the BT server at the time and did not send it
straight away. After reading these postings by yourself and Dennis
im glad that i didn't send it.

> Whjy can't these programs be released freely?
Because the author has the right to say what is done with his work.

> Is TUS still operative?
Yes it certainly is. If anyone rings on the old phone number (as many do)
then they will get through. I do prefer email that i take on
dave@btinternet.com
but this will be changing shortly. I still supply some upgrades for the STE
such
as Veloce and internal IDE drives and do repairs.

> If not, I certainly can't see any finanical
> reason why they should be held back, but of course this isn't up to me.

Of course not, they are not your property.

I was also going to release a range of test software that i wrote for the
platform (around 20 programs) that others would have found usefull.
But after reading the stupendous posting by Dennis (ah, i didn't respond in
a couple of days) i can see no reason to release anything. Therefore the
answer is NO.

Dave

Ah, so you agree that I was not asked directly. It is polite to ask the
author.

> the intention
> was there.... thanks for nothing!! :-/
>

And what is that meant to mean?

Dennis, you have surpassed yourself this time. If you where any further up
yourself then all would be left is a black hole. Your attitude to others is
appalling if you are not directly involved, the Atari world does not revolve
around you. It is no wonder that people leave the platform / group when
they have to put up with you and your so called mates.

I will take your "thanks for nothing!!" comment and simply add "that's what
your getting"

Utter contempt (as you have shown)

Dave

Hello,

I recently (within the last year)
wired a Link 97 intern in an External Case with SCSI drive.
Dr. Seimet and Newsgroup helped me configure HDdriver.

It works very well.

He also sent a nice catalog (Atari) with the order.

I know I sound negative, but I'm just providing arguments in order to explain why I don't believe in such a project. So let me ask: If this is correct, why haven't they already started?
Another argument why I doubt that there will be any result: Writing a decent browser (even without support for Java, which is a separate issue) for the Atari will take appr. two man years, or even more. So let's assume there are two programmers starting with this right now. They would be finished in about one year from now, provided that they make it a full time job. Do you think they can both live for at least one year with $1000 or even a multiple of this sum? And when they are finished after a year they would have to learn that most of those who pledged to pay some money for the software were not willing to wait for a year.
I get the impression that some user think just the fact that somebody *might* be willing to pay a certain price for a non-existing piece of software will result in this software being available soon. That cannot simply be the case. Developing software takes time. Developing a large project like a browser will take a lot of time.

Writing a browser is no easy task - I know that from doing a sort of "HTML parser" for my web editing tools. There's hardly any support from the Atari OS (e.g. to display GIF images or handle frames), HTML is very chaotic in a way and then there's also JavaScript, CSS etc. ... After the parsing is done the result has to be displayed correctly. The only help the programmer got is NVDI to use vektor fonts. Everything else has to be done by the programmer.

People want a modern browser but a lot of you have unmodern machines. I personally don't think there is a way to have a modern browser running on a TT. A better way would probably be to port an existing browser and use a fast Atari clone instead.

Greetings,
Matthias

Just downloaded and read this mag - another fine effort.

I had just one problem: Clicking on any of the images on the Classic Atari Images 2 page causes CAB 2.7 on my Falcon in 256-colour mode to crash with a 'Memory Block Destroyed' message. The photos are in the right folder, and they show OK from the desktop using the Apex jpeg viewer.

Anyone else have this problem? And any idea why this happens?

BTW, am I the only one who finds having to go back to the main page after each item a nuisance? It would seem better to have a link to the next page - or even all pages - available at the bottom of each page so that one can go directly to them. What do others think?

Regards, /Peter/

Two things.

Experiment with the program flags of the scanner prog, might need to be
set to not run or allocate memort in TTRAM

And try running Steffen Engle's "scsidrv.prg" before running the scanner
driver.

You can get that in the CBHD driver package or in the GEMAR tape streamer
package.

Source record: 43949

OK I know it's a long shot but I hope someone can help.

In the late 80s there was a company called ROMBO productions that made a video digitiser for the AtariST Called VIDI-ST and there was a hardware/software add-on called Vidi-Chrome which allowed you to do full colour captures (rather that just 16 or 32 shade captures).

Anyway, I'm trying to find out if the company is still trading and how to get in touch with them.
I've tried an internet search with no luck, but do remember that they were based in Livingston in Scotland. if any one knows anything can they let me know Thanks.

The reason I need to contact them is that the disk containing the colour capture software has become corrupted rendering the hardware useless without it.

Alternatively if anyone knows where or how I can get hold of a copy of the software VIDICHROME for the ST , please get in contact

Thanks again

Mark

1484. Misc ST Items FS

Newsgroup: comp.sys.atari.st
Date: 2001-07-09 02:35:48 UTC
From: fmhcom@operamail.com
Message-ID: <8M827.1462$J43.5729@newsfeed.slurp.net>
Source record: 43947

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $35.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured

word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

The Complete Atari MINT CD by Whiteline. Everything you could ever
want/need with MINT for your Atari computer. X11, PERL, HUGE, TCL,
GNU C++, MINTos, MINTnet, FTP, Telnet, and all the MINT Distribution
kits. Over 330 Meg of data. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

1485. Re: Atari Browser poll

Uwe,

You have every right to state your opinion. Do you sound a little negative, Yes. But I feel you are being honest about what you believe. Besides.. good debates are heathy!

I know a GOOD browser is very hard to create with the Atari platform. But after being in the Atari community for so long (2600/8-bit days) and seeing what HAS been done over the years.. I think something can be done. True.. what some people are looking for might only be able on an 030 or better system.

You asked "why haven't they already started?"
Someone did.. His name is Robert Goldsmith(?) It is named Highwire.
The Highwire code has good promise, which is already displaying html pages. (except Tables, images and frames?). and it is fast. True.. ALOT needs to be done with the code. Unfortunetly, Robert had to stop working on the code due to his studies. But He has released the code into the open source, I don't recall the license he released it under.

What if some of the open source code was used/ported? In the Unix/Linux world they have a few decent browsers that are small and open source. I'm hoping something can be done from that end. I know.. why haven't they tried.. have they had any real incentive? If a team could get to split a few thousand (ok, possible) dollars.. wouldn't that be somewhat of an incentive?

To others in the group.. what are your feeling on porting an open souce browser to the Atari? and before someone says it.. Netscape/Mozilla are OUT! They are HUGE! The source code is 31.3 MEGS!

Myself and others believe that we DO have a chance with this.
Like I was always taught.. you will not know unless you try!

If there is a large number of pledges for a updated Browser, why not
offer it to CAB as I sure the MAC version would have to handle JAVA and
more???

Donner.......

The Mac version of CAB does not have to implement Java separately. If
Java has been installed on the Mac previously iCAB can make use of this
already installed version. On the Atari the situation is completely
different because there is no Java at all.

Thanks Uwe,
I only mentioned Magic because the Fastboot program I used with TOS
destroyed the memory block (as your Hddriver stated). Hence the reason for
a Magic compatible bypass!

Hi Uwe,
So a re-work of CAB might be more logical than a browser from scratch!
Getting ASH (Alexander) to release the source code for the Atari version
of CAB would help. Don't ask me how that will be done but it's a different
path.
John G.

There will _not_ be any further development of CAB. Ever. See
my homepage for details, under the "Publications" section.

Wrong.

What you mean to say is: On Atari there is no _standard_ Java
machine, which would make the integration easier.

Please note: a port of Kaffe _does_ exist on MiNT.

And this port works, including the AWT? And it is a port of a current
JDK and not 1.0.2 which is completely outdated? Without the AWT it's
quite useless, in particular for browsers.

>Once again you are sticking your beak into other peoples business. I
>suppose that by acting the way you do it justifies other people jumping
>into postings by yourself.
May i remind that this is a public forum? if you choose to post here
then it's everyone's business....

>What's it got to do with you _ANYWAY_?
I consider myself to be part of the Atari community, so *i am* involved,
like it or not...

>Ah, so you agree that I was not asked directly. It is polite to ask the
>author.
Ofcourse i agree, since Hallvard had no idea you were the author he had the
common decency to ask about the status of the software publicly. There was
absolutely no reason to treat him the way you did.
You're the author of the software so you decide whatever happens with it,
but to add a sentence like "If you had asked me then i wouldn't have had a
problem with it" is enough to revoke some action....
Without actually writing it, you insinuate that because of the "unpolite"
way in which Hallvard handled this, the entire Atari community has to
suffer... you don't want to give your work the freeware status and have the
nerves to publicly blame Hallvard for it !!

>Dennis, you have surpassed yourself this time. If you where any further up
>yourself then all would be left is a black hole. Your attitude to others is
>appalling if you are not directly involved, the Atari world does not
>revolve around you. It is no wonder that people leave the platform / group
>when they have to put up with you and your so called mates.
I will not stand by idle while you take the mickey out of a long standing
member of this group, Hallvard is one of the people here who has done far
more for this community then you can ever dream off, he doesn't deserve a
reply like the one you served him. If that's an appalling attitude, so be
it.

As the author you hold the legal and intellectual rights, you don't have to
explain why you don't want to release your work, but blaming Hallvard for
it, that's what I find appalling.... as for people leaving this platform, I
put it to you that more people left this platform because of the treatment
received by their trusty dealers. It might have gone unnoticed to you, but
in this group we help each other...

Again: thanks for nothing :-/

Cheers from Belgium
Dennis

Ok! The new Bootconf worked fine! The system loaded without the memory check. I also used Magpatch.TTP to bypass the search for an IDE (no IDE in the MKI). It still took about 40 seconds to boot but it's a lot better than what it was. Running Hddriver 7, Magic 6 and a load of stuff in the Auto folder (NVDI, SAM, Stik..).
Thanks again for all the help,
John G.

I'd like to correct this again: It's not HDDRIVER that displayed the
message about the destroyed memory block. This is a message of MagiC.
MagiC uses a special kind of memory protection (not the one based on the
PMMU MINT uses) and thus is able to detect certain memory allocation
failures.

Hi,

Mike <windfall1@sympatico.ca> wrote:

> What versions of Linux will run on a TT?will REdhat 7.0 run with
> Wordperfect?

You need a Linux distribution which supports m68k CPUs. AFAIK, RedHat doesn't offer m68k binaries. At the moment only Debian comes to my mind. But you won't be able to run WordPerfect. AFAIK its source code is not available, so no m68k version can be compiled. Besides that, although TTs are nice machines, for software monsters like WP they are not fast enough, especially not in combination with an underlying X11 server system.

Best wishes,

Kerstin

Debian will work. I have used Debian with both the 2.0 and 2.2 kernel

versions. I know there was some work being done on a m68k Redhat

version, but I don't think it is a complete release and most likely

not stable.

Hello,

According to an article about the installation of Linux on Atari in STC
7/2000 you can only use the Debian Distribution available on ftp.debian.org
Download :
1)pub/debian/dists/stable/main/disksm68k/current/atari/Atariinstall.lzh and
2)pub/debian/dists/stable/main/disksm68k/current/common/base2_1.tgz

Cheers
Dan

Hmm, I recently tried to get SAM working on Magic and Jinnee but it didn't play the sounds even though you could from the acc and the box "sounds enabled" was ticked and the only sound to work was start up sound. I think it worked OK on my old STE with TOS.

Hi Hallvard,

Firstly I have no axe to grind with you. I respect you for what you
are doing in the Atari community as you obviously enjoy the
platform and the friendships it brings. I will admit that upon reading
your original posting I felt that you were basically presuming the
software was freely available by asking someone to make it available
on a website in the same sentence. Rightly or wrongly I sent the
posting setting the record straight. As I have stated previously I was
going to post it all to you but after reading remarks such as
"thanks for nothing" by Dennis then can you really blame me for

saying NO. To be honest, the software is nothing special, it was
written to perform a task that is does without any paraphernalia.
I am sure that other users have the full suite of HD software written
by TUS (I can't find the master disc at the moment) so if someone
else sends it to you then do with it as you wish.

Enjoy your Atari escapades.

Dave

1514. Eclipse Compatibility

>
> Again: thanks for nothing :-/
>
You nearly left me typeless. What the hell have you got against dealers?

I put it to you that this has nothing to do with software it's all about
dealers?

We have already seen your postings about dealers that were lies on YOUR
part. I have nothing to loose by calling you a self opinionated wanker
as i don't have a vested intrest in the platform anymore. You invade this
group with your verbal shit without regard to others. You are nothing
special,
i am sure we could all translate. However, to innovate is a different ball

game.

Up yours from England

Dave

I think Red Hat works, but I know there is a Debian Linux version that
works. I can bring it up on my Hades. I am just having trouble
initializing a partition for some reason. Of course you could get
Mint/MintNet working. Thus you could bring up Unix programs on the GEM
desktop.

this is quite amazing, some guy has a problem, there is speculation as to the the cause and remedy, as I have had first hand of this problem I offer a solution that seems welcome, someone offers to put the prgs on a site, the author shows up and through some delay and confusion in postings the whole thing develops into a fight.

please calm down and rethink what this is about, people helping each other on an old platform with old programs, let's make this group a pleasure to visit and not a scrapping ground, there is enough of that in the world at the moment.

I think you will find that only Debian is catering for the Atari market. The Red Hat might be
supporting Amiga (spit). Also Netbsd as well for us, but only really for the Falcon or graphic card
holders.
What problem did you have when you were initializing a partition. My problem I had was with NetBSD trying to return back the partition to linux. NetBSD play silly bugger with HDDriver.sys It
is better to work with a spare harddive.

Hi Don,
Some things to check are, is the last drive on the scsi chain terminated? are the drive(s) on separate scsi id's? and some host adaptors don't like it if parity is enabled on scsi drives. Sorry if these things seem simple but its often simple things like that which trip people up, including me.

James,

I have tried terminating the drive and the system bombs. There is also only one drive and Ive used different ids to boot with the same result. I know its something simple thats just escaping me at this time. Ill most likely have a nightmare about it this week and that should help e remember what Im forgetting to do.

Thanks,

Don

This is wrong. A lot of people are using Quantum drives with the Atari.
I have several of them, e. g. my TT's internal drive is a Quantum drive.

Some Quantum drives require the computer to have an SCSI ID of its own
(initiator identification). These drives only work with the TT/Falcon
(but not as a boot drive) or with a LINK96/97 host adapter. Other host
adapter do not provide initiator identification.
Give us details on your drive, maybe we can tell you whether your drive
requires initiator identification or not. If not, your cables may be too
long or the drives are not properly terminated.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 07/04/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $5.15 shipping, due to
weight, counts as 1st item
$ 4.00 Death Sword (Epyx)
$ 4.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 4.00 Final Assault (Epyx)
$ 4.00 GFL Championship Football (Gamestar)
$ 4.00 Keith Van Eron's Pro Soccer (Microplay)
$ 4.00 Lands of Havoc (Antic Software)
$ 4.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.00 Metro Cross (U.S. Gold / Epyx)
$ 4.00 Paint Pro (Abacus Software)
$ 4.00 Quadralien (Spinnaker)
$ 4.00 Renegade (Taito)
$ 4.00 SwiftaR (Accustar)
$ 4.00 Techno Cop (U.S. Gold / Epyx)

$ 4.00 Warship (Strategic Simulations, Inc.)
$ 4.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 4.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 4.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 4.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 4.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 4.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 9.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.15 shipping, due to weight, counts as 1st item

$ 9.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 9.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 9.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 9.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 9.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 9.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.15
shipping, due to weight, counts as 1st item

$ 9.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.20 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi Lyndon,
Same here! With Magic, SAM is only playing the system start-up sound
on this Falcon MKI. The box ticked is to enable the system sounds of those
not chosen in SAM (I believe).
There are a number of programs I run under TOS 4.04 like Cubase and
BackloadIII that won't run with Magic. In some cases I'm hoping it's just
a configuration problem.

I was more thinking about Workdplus requiring libraries like Motif,
which I thik have not been ported to GEM. Unix programs that just rely
on the X toolkit are an exception to the rule.

>path.

And what about a rework of that French browser Wensuite? Its damned
fast. Quite some time ago I did a test:

Test: reading offline a test page containing 13 midsized prog. jpg's
(35-65 kb) and two small gif's.

1) Cab 2.70e: load time: 1'46"31
2) Cab 2.80: 0'49"75
3) Wensuite 3.30c: 0'17"82
4) Adamas 1.72 pl3: 1'24"86

AFAIK, Wensuite has been put on ice. However last year the author was
thinking to release Wensuite as open resource. See original (French)
message below.
IMHO Wensuite would be a far better starting point then Cab.
I don't know the e-mail address of the programmer, Fabrice Bamas.

Newsgroups: fr.comp.sys.atari
Subject: Wensuite et le Javascript
Date: Mon, 31 Jul 2000 11:38:19 GMT

Bonjour,

Bref, c'est vrai qu'il y en a marre de ces incompatibilitï¿½s de sites
avec les browsers Atari. Sur Wensuite, nous sommes trï¿½s en retard sur
les derniers "standards", et c'est vrai que l'on ne peut pas fournir.
Je rï¿½flïï¿½chi actuellement ï¿½ passer une GROSSE partie de WS IV en
"opensource", ce qui permettrait ï¿½ chacun d'apporter sa pierre ï¿½
l'ï¿½difice, et d'en faire bï¿½nï¿½ficier tout le monde. Qui dit "opensource"
dit aussi gratuitetï¿½ dans ce cas !!!

Le Java n'est, ï¿½ mon sens, pas utile dans le cas d'un browser, au
contraire du Javascript. Cependant, qui dit Javascript, dit aussi
compatibilitï¿½ Netscape ou Explorer, dit aussi feuilles de style, DHTML
...

La bonne nouvelle dans tout ï¿½a, c'est que la structure interne de WS
permet d'implanter tout ï¿½a sans modifications majeures. Par exemple,
l'"Open Display" (une technologie made in Oxo) est similaire ï¿½ du XML
...

Quand aux reproches qui nous sont fait de ne pas vendre nos produits ï¿½
l'ï¿½tranger, je me permet de rappeler que ï¿½a ne regarde personne dans le
sens que ï¿½a n'accï¿½lï¿½rerait pas le developpement, BIEN AU CONTRAIRE. Je
rappele d'ailleurs ï¿½ ce sujet qu'ï¿½ une certaine pï¿½riode, nous subissions
des attaques en rï¿½gle sur ce newsgroup de la part d'une certaine
personne, par ailleurs trï¿½s apprï¿½ciï¿½e sur les newsgroups ï¿½trangers, et
qu'il ï¿½tait hors de question de nous laisser dï¿½molir sans rï¿½agir (car
nous n'avions pas la possibilitï¿½ de nous dï¿½fendre aussi en anglais et en
allemand). A partir de lï¿½, j'ai annoncï¿½ publiquement que nous ne ferions
pas (ou plus) de versions ï¿½trangï¿½res de nos produits, afin d'ï¿½viter
d'ï¿½tendre la polï¿½mique ï¿½ l'ï¿½tranger. Cette remarque a fait ricanï¿½,
pensant que c'ï¿½tait du chantage. Mais bon, on ne va pas nous reprocher
maintenant de respecter notre parole.

That's not correct in general. SCSI devices, in particular can be
detected any time. It is absolutely legal to keep a SCSI device switched
off when booting and switch it on afterwards. Whether it can be used in
this case only depends on the software that is going to access this
device.
In particular, when you are using certain software that is based on the
SCSI driver, you can switch on the device and then run a bus rescan.
(This is supported by HDDRUTIL when using HDDRIVER.) After the rescan
you can, for example, use GEMAR in order to access your streamer. Or you
can then partition a hard disk drive that was switched off before.
This does usually *not* work when a resident program is required to
access the device and this program has already been started before the
devices was switched on. But as long as the application that needs to
access the device can be started after the bus rescan it will be able to
correctly access the SCSI device.

>I don't understand. What does NetBSD do with HDDRIVER.SYS, which is just
>a small file on a TOS compatible partition?

Hei Uwe.
When I rebooted back to Atari setup it would 4 bomb me. I discovered that it
bypass hddriver.sys, hence hddriver not initializing my harddrive. I also notice when I
manage
to re-install HDDriver the system had slowed down on bootup at HDDriver source(not very
nice).
This is nothing to with your software but with NetBSD changing the partition to such a
extent
I had to format the harddrive to get everything settled for me to put Linux back in. It
does mention
in the NetBSD documents the Atari uses only a small percentage of MBR and request whether I
want
to use this root which Irefuse. Does give you any help.

No, there is exception since none of the X libs (including toolkits) are
ported to GEM. Frank has already compiled Lesstif for MiNT, even if
it's
untested yet. There is no necessarity to port these to GEM, only to
MiNT.
But there is a problem: due to the lack of real shared libraries in
MiNT
all binaries become memory monsters, e.g. xlogo is nearly 1 Mbyte.

I have a 386SX, 20Mhz with Gemulator for DOS and it only gets up to
roughly half the speed of an STfm. I tried installing NVDI but it crashed
on the install program. I'd recommend a good 386DX 50 or a low end 486 to
emulate an ST OK.

I keep my CAB cache on an external MiniS and quite often I'll forget to
turn it on. I copyed and renamed HDDRIVER.SYS to HDDRIVER.TOS and when
loaded from the desktop it pops up in a VT52 window and then I can access
the drive.

I have a Link97 (I think), it will ONLY work with a Syquest 88/200 drive. It will not detect any other SCSI device. I suspect it is the same as what Halvard has just said and my have a problem with term power. I also suspect the syquest is providing ample current and doing the trick. But the SCSI hard drives aren't. Could be the same problem as above. Also the Syquest will only boot using the ICD pro utils.

A few years ago I successfully installed Linux on the Hades using a 1gig Jaz cart. Now I am trying to re-install it and for some reason I keep getting one of two errors: 1)Free List corrupted and 2) Free List Empty when I try to initialize a parttion. If I new what those errors meant, I may be able to do something. I am also trying to figure out what is different about my system. I know I upgraded the TOS, but I put back the old TOS and still get the same errors. I tried re partitioning the partitions using the Atari fdisk program and still nothing. Got me stumped.

Back when Opera made the call for porting to marginal platforms,
Atari was dismissed both for its small number of requests and
because of the absence of a common multitasking API between MiNT
and Magic.

Well, maybe not. Most (if not all) Atari rights were sold by Hasbro
to Infogrammes. On the other hand, Milan apparently has a license
from the Tramiel version of Atari to use TOS. I don't know the
details of the license, but I suspect they could use it to distribute
a TOS version of another company's hardware without violating any
laws.

Hi John,

A true conversion to Atari is darn near impossible, but emulation
works fairly well.

On the Mac side, MagicMac and a 100 era Powerbook gives you in essence
a GEM-only STacy. Just don't try anything without a graphical
interface (like 98% of games).

On the Windows (or DOS) side, you could use Gemulator or STeem in full
screen mode.

I have a Mac Powerbook 180 I'm playing with. Jinnee, NVDI, and
MagicMac are installed and running, but no programs yet (limited time
to play). On the Pentium II notebook I'm typing on, Gemulator runs my
grading program quite nicely.

First of all, although it shouldn't matter, use ID #0 or #1 (the
system goes in order to check, and it can time out).

Secondly, termination matters. I have had a drive with a
nonfunctional termination switch before. That is to say, switching
termination on did not switch termination on. A pass through
terminator is fairly inexpensive and stays in my toolbox now.

Thirdly, cabling matters. There is a reason why you can spend $50 on
a SCSI cable. If you are using a used cable, try another one. If
your cable is anywhere other cables, see if moving it helps.

Fourthly, the drive's settings matters. Some drives, for instance,
have a setting where they don't even start spinning until they get a
command to do so. Kindly post the model of your drive and we'll try
to figure it out.

True. Note however, that the Jaz is a removable drive, and removable drives are not as well sealed from dust as traditional hard drives. I personally would be reluctant to put my only copy of anything important on a removable drive (in fact, I use mine solely as mastering space for CD-Rs).

It would help if you knew the page that didn't work, but I suspect
either a problem with GDOS or a setting off. I know CAB 1.5 works in
medium resolution via TOS 1.62.

> Another thing: His HTM file didn't display properly for some

Well, I got Twilight working, kind of.

It saves my settings (Thank you, Mr. Baiz) and works fine ONCE I select it from the Desk menu. In other words, upon booting, I have to call Twilight to the front once. Then it works fine. Ah, well, still more to experiment with.

As to Bubbles, although that does indeed work, the range of modules is vastly inferior and significantly more vulgar.

The drive is a Quantum ProDrive ELS 160MB SCSI. The host adapter is a ICD Host adapter (advantage). Its the older one that needs a power supply and a case to house it in. The cables SCSI cable is 2 foot long and the DMA cable is 2 foot. Ive terminated the drive and have also tried a terminator plug. The drive is the type that takes the resistor packs.

The only thing left is to try a different drive.

James,

Ive violated lots of SCSI rule on my TT030. The Quantum drives(3) are all the same models and are installed in a case with SCSI 6x CD ROM none of them have any termination and have worked perfectlly for years. I also have terminated the last drive and the system still worked. Ive terminated the 1st drive and the system still worked. The only time I had probelms was when I added a scanner then it had to be terminated. Other than the last problem everything else has worked flawlessly.

1568. Hard Drive/Extendos Help

Newsgroup: comp.sys.atari.st
Date: 2001-07-11 05:42:13 UTC
From: jdplace@prodigy.net
Message-ID: <9igovj$118k$1@newssvr06-en0.news.prodigy.com>
Source record: 43936

I'm trying to add a larger hard drive (a Seagate ST32151N), and the drive formats, partitions, and boots fine, operates fine on it's own. The problem I am having is that it causes my CD-RW to freak out, and it also corruted the files on my other hard drive when I had them chained together. I am using ICD drivers and Extendos Gold, with a Link II on a 520STe. Everything operates fine with my Maxtor drive. Can anyone help?

Hi,

TosBox is great for GEM work, it feels like a fast ST clone. Steem is better
for games.
I use TosBox on my old Compaq LTE5250, an old P120 with 80mb, and it works
great.

Regards

/Peter

Hi All,
There may be other interested people in the poll in other NGs such as fr.comp.sys.atari and I believe there's a German one also. I'd offer to make those posts but I don't know either language! So if a good browser came of it we can worry about translations later (been doing that anyway)!

The only way to do this is to modify the root sector of the drive or the
boot sector of your boot drive.

> to re-install HDDriver the system had slowed down on bootup at HDDriver source(not very nice).

This is very strange.

> to use this root which Irefuse. Does give you any help.

The only thing I can say that NetBSD must be doing something weird and
if something has to be fixed it has to be fixed in NetBSD.

Open source does not mean that there is also a port for the Atari. This is a thing that would take a huge effort. Often I get the impression that some users think such a port can be done within a few days or that new browsers can be written in a few days. Usually this takes months or even years.

I recommend having several backup media, not only a single cartridge
where a new backup overwrites the old one. In case of a media failure
you will not use your only backup this way.

If it has worked for you, you have just been lucky. I know of many
problems that eventually turned out to be termination problems. I
strongly recommend not using a SCSI system where you know it is not
properly terminated. It can even happen that only certain areas of a
drive cannot be correctly accessed when something is wrong with
termination. This is simply dangerous.

Hiya

Check your cables!

I had the same problem and it ended up being a low quality cable, yep it
was a brand new one at that.

Also check the cable length and the terminators, especially if the drive
had onboard device terminators.

SCSI things are weird, i have an MO optical drive and i can't use this
with any of my hard drive unless my main hard drive is device ID '0' and
the mo drive is '4'!!!!!

Hi Peter,

>DC>And try running Steffen Engle's "scsidrv.prg" before running the
>DC>scanner driver.
>I suppose booting with HDDRIVER will do the same, won't it?

Ought to, sure, but I've found that scsidrv.prg to be very helpful on my system at times! For example, I have to run it before Gemar even if HDDriver has seen the streamer at bootup. I suppose it's a manifestation of my CT2 card.

I apologize. I missed the "ported to GEM" above. I was thinking in
terms of the source for Motif compiling on m68k Linux.

Anyway, I just read that lesstif has at least been compiled but not tested under MiNT. So Motif would probably not be required for some applications.
Regardless of whether certain GUI libraries are available or not a problem that persists is the fact that applications using Motif or lesstif often need a lot of memeory and processing power. This means that even if you could run them on an Atari or clone they might be unusable. I tried this some time ago with Mozilla on a TT running Linux 68K. It took Mozilla about 10 minutes to start and it took about one second after typing a character before it appeared on the screen. Even with a lot of memory and a machine that is three or four times faster than the TT you would not really want to work this way.

Did you explicitely install a boot block? Since if you do, you overwrite the
boot sector of your harddrive with the NetBSD booter. If you don't, nothing
special happens to the partition info (and HDDRIVER). I use both NetBSD and
HDDriver, but I don't have any problems at all - even with a bootblock
installed.

I don't think I understand what you are stating in the line containing
'MBR'... There seems to be something missing.

Generally, for fair speed (i.e. better than the original ST)
look for something in the 200-400MHz range. Additional speed would
not hurt, of course. There should be enough memory to install a 14MB
of emulated ST RAM. Required hard disk space- as you like it, because
emulators are quite small programs so beside the underlyig OS requirements
you just need that which you would need for atari applications.

TosBox is convenient for installing on a DOS-only base- i.e. just a
couple of essential files of DOS and the machine can practically
boot straight into a 14MB ST 'clone', with DOS being invisible
for all practical purposes.

Gemulator is good if there is a requirement for Windows to be present.
Its Atari-compatibility is somewhat better than of TosBox. It is
significantly faster than TosBox. There is also a DOS version of Gemulator,
also quite fast, but with a stupid limitation to four 32MB "hard disks".

Both emulators can run such things as Mint (older versions), Geneva, Naes,
NVDI, etc. and can be set to display resolutions such as 800x600 or 1024x768,
or even larger. However, they are not convenient for games.

Well it does and it doesn't. It does allow one to run Mint programs
like aFTP (Mint version) under Magic, but it does not allow one to run
Unix programs on the desktop. Maybe that will come later. It is still
in the beta stage.

You are correct. Anything that I want to definetly save, I put on the
Jaz cart and also back it up on a CD.

Hi, all. I'm looking for a "Mister X" image by Dean Motter that was supposedly included with Batteries Included's "D.E.G.A.S." software for the ST. Does anyone have this? If so, I'd really appreciate it if someone could e-mail me the image as an attachment.

Failing that, does anyone know of an Atari ST emulator that will allow a PC to read ST disks?

Thanks in advance!

Hmmm

not heard of this one, and i use degas!

>
>Failing that, does anyone know of an Atari ST emulator that will allow a
>PC to read ST disks?

You dont need an emulator to read atari st disks in standard file
format, or even extended format.

You need a program to put the gubbins that is needed for the pc to read
and write to it. And if you have a high density drive fitted you can
even use high density disks:)

You cna format a disk from windoze 720k you r Atari will be happy to
read and write to it, or use this command from DOS format a: /f:720.

I use a program called dc copy 3.0 which does all sort but adds the bits
needed. This is available from the Last PD library web page: www.last-
pd.co.uk

If you still have an Atari computer, you can transfer files to a DOS formatted disk that can be read by a PC

You dont seem to have mentioned your termination / cabling scheme?.

>Everything operates fine with my Maxtor drive. Can anyone help?

What are you using for a power source, if its the same PSU perhaps it objects to
the load.

My DAT drive failed after a while being in the same chain it was in for ages,
turned out it was the PSU giving a dirty +5V rail under the load of recording.

>like aFTP (Mint version) under Magic, but it does not allow one to run
>Unix programs on the desktop. Maybe that will come later. It is still
>in the beta stage.
Magic-Net doesn't fill the gap at all, I suppose it's a dream come true for people who need to put their computer in a network or have access to cable modem with static DHCP but for the ordinary user, who works with a single computer and dial up connection it's a step backwards instead of moving on...
Except for the fact that the MiNT-Net clients are free, they simply don't offer the same ease of use, features and functionality the IConnect clients offer, especially in combination with ASH Scripter there's nothing out there that will beat this combination. Enough has been said and written about this.... I'm not about to start a new war :-/

As for Unix possibly running under MagiC, what MagiC user is waiting for this to happen? If one wants to run Unix crap he can install Linux or NetBSD... ask yourself why you use MagiC and reflect on it. Why settle for second best?

To stay on topic: supposing a miracle happens and the Opera developers decide to give it a go, do you really think they are going to waste time getting all the relevant info about the MINT API from various sources scattered all over the net? they will surely contact the firm that released a commercial API and that's ASH... or in the worst scenario adapt their own custom API.... draw your own conclusions.

Cheers from Belgium
Dennis

>> and Magic.
>
>Does not magic-net fill this void at this time?
No it doesn't. It's only a convertor allowing some MiNT-Net programs to
run under MagiC using the MiNT-Net stack.
On a common multitasking API between MiNT and MagiC it should be possible
to run IConnect clients under MiNT-Net and vice versa of course.

BTW: The poll forgot to ask on which stack(s) the browser should run and
even more important why... this is food for another very long thread ;-)

I've got a Falcon and would like to transfer files on its hard drive as painlessly as possible to my PC.

I seem to remember ages ago about a program called Ghost Link. Is that still around - or any other (simple - apart from the floppy route) suggestions. It would be a one-off transfer, not something that I'd need to do regularly. Suggestions, pointers to URLs would be very welcome.

TIA

Andrew Harvey

If you (or someone you know) have a CD-burner and SoundPool's CDRecorder
Pro, you can make PC-compatible CD-ROM:s with your files on.
If you're using Cubase Audio, you must convert any 16-track mode files to
8-track mode - otherwise they won't be readable by any PC program.

You are correct, magic should NOT have any command line, and ANY ttp.
We'll make sure that next version can not run any of those. That would be
too lame, especially that you can install linux or netbsd on your atari
1040 STE.

>
> As for Unix possibly running under MagiC, what MagiC user is waiting for

Correct again, command line should ONLY be available on MiNT and linux,
but NOT MagiC, I hope Dennis that ash/Andreas are listening to you, so
they'll make sure no one can run any command line, as it is totally
against the whole purpose of the GEM.

For the sake of argument let's suppose you could design a next generation $300 homecomputer. The goal is to make a userfriendly machine for general use and for hobbyists. How would such a system look?

CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this type of thing, you should be looking at the $20-35 level)
As OS? (Linux is a dead giveaway, but there also other OS's out there)
Build in programming language? (please choose anything but Basic!)
Amount of memory? (RAM and ROM)
Graphic and Sound?
Network capabilities? (internet capable)
Plug in capabilities (remember you're making it as cheap as possible so modems, CD-Roms, HD's are all extras)
Video (TV? or Monitor?)

Remember that the RETAIL price should be $300, so think in wholesale prices. The real costs should below $200 or even below the $150 level. You may presume that a million units would be manufactured so take volume discounts for components into account

Let's see what sort of systems people come up with.

Hi,

I've got my hands on an old Atari ST 1024STf (I would like to use it for Midi) with TOS 1.2 I believe.
However, no systemdisk supplied. I'm looking for a copy of the original Atari CPANEL.ACC program. Can anyone of you guys help me out ? Please mail me !

Thanks, Geert

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)
Well, in quantities, you might get pretty close for low end
Celerons....
>As OS? (Linux is a dead giveaway, but there also other OS's out there)
FreeDOS?? It's getting closer to be usable everyday....
Linux for a home user, no way, not in this decade AFAIAC... ;-)))
>Build in programming language? (please choose anything but Basic!)
What's wrong with BASIC? It's easy to be "build in", as it is an
interpreter and there are a lot of BASIC variations out there that
would stand any comparison for ease of use and performance....
Or you you suggest something more academic like Smalltalk, Lisp or
Java???
>Amount of memory? (RAM and ROM)
Not as much a question of cost (128MB SDRAM is less than $10 these
days), as of a combination of the above specs...
>Graphic and Sound?
VGA style graphics with 4MB RAM and at least 800x600, 16bit colors is
not a problem these days either..
And SB compatible sound probably not...
>Network capabilities? (internet capable)
an onboard solution with a Realtek chip and TP 10/100 RJ-45
connector...
>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)
>Video (TV? or Monitor?)
Well, a monitor is probably the most expensive part. As for the
possible graphics capabilities, a TV (if it's not a fancy digital HDTV
one) is far below the capablities of the graphics chips...
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
If you buy a million pieces of ANY component, you get FAR below the
usual retail prices. a quick look on pricewatch reveals

CPU: AMD Duron 700Mhz $24 (Celeron 700MHz $42, VIA Cyrix 700 $37)
Memory: 128MB PC133 $9
Mobo: Intel 810 $38 (build-in video!, USB, keyboard,...)
case w/ p/s $25 (ATX desktop)

Ok, that is a pretty mix, bu assuming large quantities as you
mentioned, this is less than $100 for the major parts. Add a few $10
for network and sound and smaller stuff, no problem...

>
>Let's see what sort of systems people come up with.
>
Ok, just a rough sketch, but it should give you an idea.
The problem is to finance this and to get the software for it (BeOS
might be nice, but....)
And these days, you will have a hard time selling something that is
not Playstation or PC compatible...
And than you are up against M$ with their XBox or whatever it is
called these days......

just my 2c,

Ralf

You need to make your mind up. Either it's a toy - and at $300 retail
that's all you can aim for - or it's a computer for "general use and
for hobbyists".

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

Very cheap and weak Intel or AMD CPU's then. The alternative is to go
with the stuff used in PDA's, but do you want to have a desktop or a
PDA.

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Like QNX maybe, or a ported version of AmigaOS. Other alternatives
rake you back to the PDAs.

>Build in programming language? (please choose anything but Basic!)

gcc for real programming, Perl for scripting.

>Amount of memory? (RAM and ROM)

Depends on the OS. No ROMs, they stink.

>Graphic and Sound?

There are plenty of cheap chipsets.

>Network capabilities? (internet capable)

Built-in 10/100 BaseT. Essential.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Don't be daft. There's no point making CDROMs and HD's "extras".
What, you think people are willing to go back to swapping floppies?

>Video (TV? or Monitor?)

Again, are you after a computer or a toy?

>Remember that the RETAIL price should be $300, so think in wholesale prices.
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
>
>Let's see what sort of systems people come up with.

What's the point? This is market research for the '80s. Nowadays
people aren't satisfied with a cheap jack of all trades that doesn't
do anything very well. They want a cheap games machine, they buy a
console. They want a cheap general purpose computer, they get one.
They want something cheap that does everything well, they get into a
time capsule and go back to 1985.

Anyone aiming to produce computers that retail at $300 is going to be
peddling a pile of camel dung.

AFAIK the last version of Ghostlink still only let you access the PCs
drive from the Falcon and not the other way around. However thinking
about it you could access the PC drive and dump the files from the Falcon
onto it. However (again!) it may have problems if your drive in the PC is
FAT32 or even just being a large partition. I would go for an old
terminal aproach with a null modem cable with speeds around 6-12k/sec.
I'd use Connect on the Falcon and either Hyperterminal (yuk!) or Qmodem
(nice!). If these files are large you can use the parallel port to link
the two but prebuilt cables are sometimes expensive. I think the software
for this is called PARCP or something.

It was a page he had written in HTML, but I don't think that
matters because CAB never got as far as initialising - as I said
it hung with its small 'Loading xxx' (modules etc.) dialog. He is
using GDOS 1.1 with suitable fonts. The system worked fine on a
high-rez monitor and also when using Sebra to emulate hi rez on
the TV. But I agree, it /should/ have worked in med and lo rez
too. I don't know whether the combination with TOS 1.02 could be
the problem? And what do you mean by 'setting of'?

The header and all further paras were OK. It was just the first
para after the header that was in small font.
>
>Your last problem is strange as "" isn't standard
>HTML, as far as I know.

Yes, I thought that was the case. However, it worked (though the
background colour was white - but then it would be in high rez)!

Two points.

Firstly, what's so bad about Basic? It's entirely possible to write structured programs in any decent dialect (BBC Basic being a case in point), and the mere posession of a GOTO statement is not in itself the mark of the devil.

Secondly, why does there have to be only one built in language? Look at the BBC Micro - 4 ROM sockets (expandable to 16), allowing you to have several languages resident at once, switchable by software commands (eg *BASIC or *PASCAL).

[1] Yes, I do own one, and it's great.

>

It would probably look very much like the e--Machines system I just
bought my daughter to take to college with her.

600Mhz Celeron
32 MB RAM
8Mb SVGA Video integrated on motherboard
Soundblaster compatible integrated on motherboard
10 GB Hard Drive
16x DVD
Keyboard
Mouse

Cost? $269

(OK, I got a deal because these were "returned" systems from a company
that canceled a contract. They had to be sold as :"ref urbs" because
they weren't "new". Big deal.)

Oh, and I added a 10/100 card for $14 and 256MB RAM for $55

She probably could have gotten by without the RAM, but why?

The price is in the $300 ball park and it's a system she'll be
familiar with and can make instant use of. The software it runs will
be compatible with most people she runs into in college. It has a
software base that no new computer could challenge for decades.

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

And looking at incompatibilities? Let's choose something no one else
runs at present just to be different? Something with no software
base? Something that will have to run an emulator (and slow it down)
in order to have any programs to run?

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Gak. You said "userfriendly" up there. Linux is out. Waayyyy out.

>Build in programming language? (please choose anything but Basic!)

Why not? BASIC is userfriendly. It uses natural language. It was
designed to be easily usable.by anyone.

Why choose something that will only discourage users from learning it?

>Amount of memory? (RAM and ROM)

RAM is cheap. More is better. Decide on the actual amount at the
last minute depending on the final cost of the unit. Put in as much as
you can to bring the cost up to your final limit.

ROM is nice, but restrictive. Atari was hobbled by the difficulty of
releasing bug fixes to its TOS operating system because the OS was in
ROM. (Well, that was one of the reasons.) But it was VERY nice to
have the system boot in seconds.

>Graphic and Sound?

Yes, definitely.

>Network capabilities? (internet capable)

Of course.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Why? When you can buy a system like I described above. Who is going
to buy a stripped down box? Will it have a cassette interface?

>Video (TV? or Monitor?)

Using a TV will restrict the output to 40 columns. Nice if you're
currently using a VIC-20, but who is going to do anything but play
8-bit games on a TV?

>
>

Well, I've already got mine. (I'm designing roller coaster tracks
on it right now. I'll probably take that off before it goes off to
college with my daughter though.)

hmmm... I think "Next Generation" and "$300 Home computer" are diabolically opposed.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

AMD Duron 700MHz, 24 bucks. Powerhungry? who cares, I have a wall socket.

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Optional, included OS's are evil.

> Build in programming language? (please choose anything but Basic!)

"Next Generation" and "built - in" are diabolically opposed, why plan for obsolescence? (and what's wrong with Basic?)

> Amount of memory? (RAM and ROM)

256MB PC133CAS2, a whopping $50. To hell with ROM, ROM only seals the fate of the shortsighted. Anything "Next Generation" should have no ROM, hell, even the BIOS is going the way of the dodo.

> Graphic and Sound?

um, yes. ;)

> Network capabilities? (internet capable)

yes.

> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)

It's cheaper if they're NOT extra's.

> Video (TV? or Monitor?)

Grown men don't find sitting indian style on the floor in front of the family TV acceptable. Monitor, please.

> Remember that the RETAIL price should be $300, so think in wholesale prices.
> The real costs should below $200 or even below the $150 level. You may
> presume that a million units would be manufactured so take volume discounts
> for components into account

Why $300? If I want "Next Generation", I'm ready to pay for it. I'd rather pay $3G for a useable PC than waste $300 on something crippled to "cut corners" that doesn't do what I want. Money is /hardly/ an entry barrier these days.

> Let's see what sort of systems people come up with.

While interesting, the "Next Generation" PC will hardly be revolutionary because of its hardware or its cost. Both those barriers are /hardly/ barriers any more. The area society would most benefit is computer science research, Operating Systems and User Interface design are what will make something "Next Generation", not cheap hardware or retail price.

It should be small and cost-effecient. $300 is WAY too much. let's say
$150 is quite affordable. Also it should be able to emulate numerous of
those old home machines and the emulation be changed in software.
Nowadays it is possible to make chips by programming them.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this

> Graphic and Sound?
> Network capabilities? (internet capable)
> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)
> Video (TV? or Monitor?)

Cpu would be Western Desing Center 65816 and a z280 or a z380. Both
would share the same memory, and there would be 16 megabytes of ram
memory and bankable one megabyte of video memory (so that it can be
mapped to either cpu's memory area). Also they could run their code
simultaneously so that when the machine is emulating a 65xx machine, the
z380 emulates the old chips in those systems while the 65816 runs the
code. Also, when a z80 machine is emulated, the 65816 takes care of
chipemulation. Also some of the memory would be relocatable in software
so that the old chips, roms and so on can be easily emulated. The clock
speed of both cpus should also be changable in software.

The programming language would be c++ or c or assembler. Also basic
would be considerable. Only needed rom would be the code starter roms
for both cpu's and a boot rom. The rest could be loaded from an ordinary
ide hard disk drive. A dvd-rom would also be a good there; it can store
much information and can possibly be used to watch dvd. Also if it is
made bootable it would be fine.

As a graphic solution a svga driver chip would be superior. As a sound
chip a creative sb16 chip would be fine. It has fm and 16 bit stereo
dsp. A ne2k compatible rtl8019 would be fine for networks.

>system.

One note: Amiga browsers are very fast and definitely nicer than CAB. They're
not as feature-rich in the HTML field as Netscape or M$IE (though much nicer
to work with), but good enough for just about every use. Striking a deal with
an Amiga developer seems much easier than coercing Opera to make a port.

>You asked "why haven't they already started?"
>Someone did.. His name is Robert Goldsmith(?) It is named Highwire.
>The Highwire code has good promise, which is already displaying html pages.

Did the poll ask the users whether they would be willing to wait for one
or two years for any results? I got the impression that a lot of users
think that projects like this yield results in a few days or weeks. Even
if there was sufficient commercial demand (i. e. users willing to pay
money), would those promising to pay money still pay after one or two
years?

This is correct but I think most users don't know at all what the term
"stack" means. So they would not be able to give a meaningful answer.

First of all, it would be two different systems:

A "userfriendly machine for general use" could very well be a closed
machine, like e.g. the early Macintosh models. The user just wants to
use such a machine, without caring about the inner workings of it,
much like you e.g. watch TV without bothering to understand how the
TV set actually works.

A machine "for hobbyists" would be different: it would be open, well
documented, expandable, etc -- more along the line of the Apple II or
the PC's. This machine is for people who want to poke around in it.

(with apologies for the huge cut and past of one of my previous posts)
CMD made an attempt with GUS - 3 x 65816 at 20Mhz, SCPU 128 architecture and some other neat ideas. The arrival of cheap PCs killed the project. The problem with cheap PCs is that their first-time owners tend to treat it as an appliance, and paying expensive bills to get problems fixed, or to purchase entirely unnecessary application software for more than the initial purchase price of the box.

One of my favourite "toys" was an old Dick Smith (Funway?) Electronics Learning Kit. It was a board with springs (to join the hookup wire), components, and project sheets. Simple, fun, and educational. Especially since there was no need for that ten-year old to to wield a dangerous soldering iron and play with mains electricity. Which leads nicely into...

If the C64 was going to be ressurected in a modern form, it would have to be something entirely different from a PC, and aimed at an entirely different market. A "learning" or "hobby" computer. Like "Mecchano" and IIRC "Lego Robotics".

Something that was:

a) Relatively inexpensive
b) Programmable
c) Childproof and newcomputerowner-proof
d) Expandable

What I'm thinking of is a SCPU-driven 64 in a PC mini tower, with real O/S that sits over the C64 BASIC/KERNAL package and provides a protected environment for a new BASIC or PASCAL with strong visual and audio support. A component system, similar to Borland's "Delphi" would be really nice.

The O/S would be scaleable -
* A "Childrens' Mode" which allows a subset of the programming languages and lots of presets for stuff like printer output, menu-driven educational titles, etc (in ROM?). Perhaps a point-and-click programming language with built-in music to make "games" similar to the old Commodore "babysitter" titles ala "Pinball Construction Set".
* A "Hobby Mode", perhaps using a hard-to-get-at hardware switch which allows access to the guts of the machine, and 64-mode, etc. A redesigned "hobby-port", basically the User port with build-in relays and perhaps a bay for a 9-volt battery to power plug-in (out of the box) hardware projects.

In all, a machine that the user can get a real feeling of being in control - no worry about viruses or crashes or constant version updates and patches. Something parents will buy for the kids as a toy but may (hopefully) discover than by plugging some extra stuff into it, can do basic tasks like wordprocessing and may not be quite the toy they thought it was.

Use Petr Stehlik's PARCP with a modified 25 to 25 pin cable - buy one from a computer fair, but look for one where you can open one of the plugs so that you can swop two wires over.

From: Matt <matt_yza@nospam_canada.com>
Message-ID: <2001713-83645-693395@foorum.com>
Source record: 43808

Hi,

A few questions for MiNT...

1. I've got a new SCSI 1Gb drive for my MegaSTE, to avoid loosing space, I want to format about 500 Mb (32 Mb partitions) for TOS and the rest with an extended format like ext2fs for Mint... So is it possible and with which utility can I format the last 500 Mb into ext2fs ? (or better format minix ?)

2. Does anybody have a english version of the Gemini 1.a (free desktop like Jinnee) ?

3. When I have re-installed MagiC 6.1, have got the message at reboot : 'MagiC ist nicht personaliziert...' why ???
Maybe my install disks are corrupted... if someone can send me his install disks.
..

Thanx

Matt

Note : remove nospam_ from my email address for personal email

An internet project already exists for a "Next Generation" CPC computer, which will use an eZ80 processor (Z80 compatible), run old CPC software, be open, have a new operating system etc. See web page at http://cpcng.free.fr/ or mailing list archives at http://groups.yahoo.com/group/CPCNG (a bit quiet recently).

I downloaded parcp recently too (just search google for parcp, it's right up there at the top of the list), but it looks like it can't handle Windows NT or Win2K yet (since it can't access the ports directly).

So if you have these operating systems, you might be in trouble. I suspect this is also the case with Ghostlink, I have a copy but haven't tested it yet.

I was intending to try out compilation of tos/mint apps on a PC using a cross-gcc then squirt the executable down a cable (a bit like console game development!), but it looks like I'm going to be disappointed unless I install something like Linux...

A PowerQUICC 862 (I'm not sure I've got the number right)
> As OS? (Linux is a dead giveaway, but there also other OS's out there)
go for linbux, it's easiest.
> Build in programming language? (please choose anything but Basic!)
why bother, just stash gcc on it's HDD
> Amount of memory? (RAM and ROM)
dunno, the stuff's dirt cheap, prolly somewhere around 32MB.
> Graphic and Sound?
Half inch a cheapo PCI SVGA chip and stick an AC97 codec on one of the PowerQUICCs serial ports.
> Network capabilities? (internet capable)
Make use of another PowerQUICC serial port.
> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)
SCSI and USB. I would *not* make an HDD an extra. They're cheap enough anyway, for a small one.
> Video (TV? or Monitor?)
Both standards, but supply neither.

No, they're cheaper these days.

What with them being a lot smaller, efficient, cheaper to produce, etc.

And I'm surround by two MIPS boxes (One is admittedly a PSone, the other is
significantly cooler - an SGI Indy), one SPARC box (SPARCstation IPX) and one
SuperSPARC box (SPARCserver 10).

These might not be be spanking new architectures, but they're superior in
every way (expect sheer clock speed) than any Intel/clone box I've seen.

That sounds like an awfully stupid design decision, why not implement shared libraries when they are so useful?

1648. [News] Icon Extract 1.1

Newsgroup: comp.sys.atari.st
Date: 2001-07-13 14:32:47 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3B4F068F.32568DB9@club-internet.fr>
Source record: 43822

Hello,
(excuse me for my english)

Thank you to all of your help to improve the program Icon Extract.
In spite of my professional work importing at the moment, here is one
therefore
new version 1.1 that corrects several bugs and integrate some news.

The program now functions perfectly on the following computers :
- Falcon of basis TOS 4.02 16 Mhz 14 Mo of ST Ram.
- Falcon with CT2 B TOS 4.04 14 Mo of ST Ram + 32 Mo of TT Ram + 68882.

- Milan 040
- TT
- PC with Magic PC 6.10.
- Imac with Magic Mac 6.10.

Advisable minimum machine: Falcon + 68882

At present, make your tests in fashion 2, 4, 16 and 256 colors.

The fashions True Color (15, 16, 24 and 32 bits) are to proscribe for
the
problems of palette and allowances memoir.

Cordially
Good downloading to all and good vacations.
F.LAFABRIE
lafabrie@club-internet.fr
http://www.club-internet.fr/perso/lafabrie /

Corrected bugs:
1 - correction of the crash on Falcon of basis and TT at the time of the
launching of the program (screen and keyboard frozen). It was about the
test of the window in first plan that made crash the system.
2 - suppress of call vst_load_font () for the display of texts of the
Userdefs objects in 3D. This one was useless.
3 - suppress of all calls to v_curradress () that was useless and that
made in certain case crasher the system
4 - the monochrome icons are henceforth correctly displayed what that
either the resolution.
5 - icons in 16 colors are displayed correctly in fashion 256 color.
6 - at the time of a new treatment of icons, the selector of file, open
up automatically in the last consulted index.
7 - more of crash at the time of the writing of the 10 RSC file (ex:
ICO32-010.RSC).
8 - at the time of the safeguard of the RSC files, there is a test for

to know the available space on the concerned reader. If the one is not not sufficient, the selector of file appears to choose another back-up path.
9 - in the case of an icon in 2 and 256 colors, the icon in 16 colors who will be created and will be protected will be it from the one in 256 colors and no in monochrome.
10 - test of the version of the XGEM interfacing (> 0.70) for the display of the associated icon.
11 - impossibility to activate the button DIRECTORY by the key ENTER at the time of a research on a file.
12 - in the case where an icon only exists in monochrome and in 256 color, the icon in 16 colors that will be calculated will be it from the one in 8 bit and no more the one in 1 bit.

ICL routine ICO to (version 1.1)
- modification of the buffers size (maximum 2000 icons by file ICL).
- modification of the routine to accept some ICLS files " corrupted ". This problem appeared with the OSX.ICL file (more than 11 Mo) where the ICO headlines didn't correspond with structures dated. The SIGNS.ICL file (given in the archive of the LBC) is also he treated correctly.

News:
1 - support of icons in 72, 96 and 128 pixels.
2 - support of icons in 24 bits (transfer in 256 colors by recalculation of the palette).
3 - choice of the icon to preserve at the time of the presence of the same icon in 8 and 24 bits.
4 - two methods of recalcul of the palette 256 colors for icons in 8 and 24 bits:
- method 1: approximate calculation (fast).
- method 2: precise calculation (slower).
5 - safeguard of several files of configuration (.CFG extension).
6 - automatic reading to the launching of the program of the EXTRACT.CFG file of this one is present.
7 - recast of the routine of preparation of the writing of the RSC files.
8 - names of icons of the RSCS files are named of EXTRACT 001 to EXTRACT 099 instead of ICO EXTRACT or CUR EXTRACT.
9 - possibility to stop the treatment in progress on icons of one index by the ESC key. A dialog box will show off at the end of the icon in treatment to either confirm no this stop.
10 - the routine for the treatment of the ANIS files integrates the henceforth same test of presence of an index to the same name that the ANI file to treat.

Yes, I believe that is possible. I am doing almost the same thing, but
I am using a separate drive for Mint/MintNet.

>2. Does anybody have a english version of the Gemini 1.a (free desktop like
>Jinnee) ?

Never heard of it, but it sounds nice. I have and use Jinnee and it is
a great desktop for Magic. I also have Thing and it is great for Mint.

>3. When I have re-installed MagiC 6.1, have got the message at reboot : 'MagiC

Hello All,

Well I am finally going to install MintNet on my Hades, I have all the files and am ready to go. I want to especially load in the X Server that will allow me to run X Window appications right on the GDEM desktop. The computer needs to be in the 256 color mode for this. The problem is that when I try to boot up in the 256 color mode, Thing gives me a BUS error along with Twilight, Edith, and Gemjing. I can boot up in all the other color modes (mono, 32k, 64k, 24bit, 32bit). Anyone know as to why this happening?

I have N.AES 1.2 and Thing 1.27. I bought the N.AES CD from Woller and Thing was on it. I am not sure it that makes me a registered user or not.

Source record: 43826

From: Uwe Seimet <us@seimet.de>
Date: Fri, 13 Jul 2001 09:01:01 +0200

Hi Uwe,

>Did the poll ask the users whether they would be willing to wait for one
>or two years for any results?
I've no idea... I don't believe in this project so I didn't participate in
the poll.

>I got the impression that a lot of users think that projects like this yield
>results in a few days or weeks.
I agree, and i also think that a project like this isn't possible anymore,
CAB was the result of teamwork, Alexander Claus provided the framework and a
group of talented programmers turned it into what it is today. The latest
attempt to produce a "better" browser then CAB was Adamas Pro, we know how
that project ended...

Not a single month passes by without another crazy project being announced
here, i'm always amazed seeing people fall for it. I'm already curious to see
what project august will bring us :-/

This reminds me of the XTOS project early this year, we were both one of the
few people here that called is nonsense, it's july now, the *BIG* month, the
month is would be released, have you seen the computer for sale yet?

>Even if there was sufficient commercial demand (i. e. users willing to pay
>money),
Where would these users come from? considering that people are jumping of
this platform by bunches, how many users will be left in 2003? I can't see
people who are discontent with CAB holding on for another two years...

>would those promising to pay money still pay after one or two years?
Of course not... one would need to ask the money upfront, but then he embarks
on a trip which would implicate legal boobytraps...
Example: three years ago I signed up for a CT-TT from Rudolphe Czuba, I never
got a mail from him in which he tells me that the project was vapourware, if
a miracle happens and it would appear next week, he can shove it up his ***,
i'm not interested in it anymore and would certainly not pay for it, even
though i signed in for one...

Cheers from Belgium
Dennis

Yes, this is possible. The ext2fs partition can be prepared with the
ext2fs tools available for MiNT.
BUT: If I remember correctly ext2fs is not supported or at least not
tested for the MC68000. This is because the MC68000 lacks certain bit
manipulations that are very useful for implementing ext2fs efficiently.
Frank Naumann should probably comment on this. I think the README
included in the ext2fs distribution also says so.

No, of course not :-). I have only read a few days ago that the
processor they wanted to use will not be available until Q2 of 2002. In
other words: If they ever want to finish the project as planned, they
will have to postpone it for at least a year. This project is definitely
dead.

> money), would those promising to pay money still pay after one or two
> years?

This thread is getting out of control I think. It was a mere poll
and nothing more, nothing less, no intention was implied that it
may become more. Now we have people making assumptions about
what others know, what others might not know, what might be done
with such money and so on. A select few would rather make assumptions
and turn them into aurguments. It's these people that knock
this group down a notch. If you don't like something, then mess it up
for the rest, that seems to be more important than doing anything
positive or simply ignoring stuff you are not into.

You can laugh at announced projects, however I managed to get one
actually done. You may not care one bit about GFA, but I do.
You probably have no clue that the goal of my contest has been
something many have tried for literally years and never got
done or managed to do. Lack of documention, company refusing to
help, and such problems. Anyone into GFA knows how important my
stupid contest was. Maybe it don't apply well to a browser,
but consider if you will it took over 10 years to get this dam
lst2gfa.ttp tool made. To this day (as of last week) the company
ignores my mails, and I even offered to flat out purchase
the full rights to GFA-Basic. Go figure...

I had people contacting me from all over, someone even sent me
source code to such a project that failed back in late 1996.

Anyway I think the assumptions need to stop, assuming everyone is
an idiot isn't helping matters. Eveyone knows CAB didn't get to
it's currently level over night. :-P

>Weird. I think you should check out a recent Linux distribution.

I've been using and sysadminning Linux for the past few years, and
none of the distributions I've tried have been sufficiently
idiot-proof to put in a consumer device*. However, that doesn't mean
that one couldn't be created.

Now that I've been using it for a couple of weeks, this 'ere Debian
box behaves perfectly. I can and do use it as an appliance sometimes,
and at other times - well, there's all the other goodies there so I
can hack away.

I turn it on, and, after a minute or so, I'm at a graphical login. I
log in and I have a desktop, with common applications already on the
desktop and less-common applications in a small drop-down menu. The
Gnome panel across the top has a clock, a battery meter, and a
shutdown button, (and cos I'm somewhat more of a 'power user' than
what we're targetting, it has virtual desktops, task lists, etc as
well). It all 'just works'. And because the important config files
are protected, dumb users can't just break it. I have to explicitly
make myself root to break it.

* - nor is Windows. How many consumer devices do you have to go
through umpteen arcane menus and options to do something trivial? Not
even my VCR is as badly designed as Windows.

1659. MiNT fnramfs 0.7

Newsgroup: comp.sys.atari.st
Date: 2001-07-13 18:34:41 UTC
From: m.tarenskeen@zonnet.nl
Message-ID: <5bH37.7075$Vs4.66433@zonnet-reader-1>
Source record: 43833

I'm trying MiNT 1.15.10b and have the fnramfs.xfs installed. When booting I see the following message (among many others):

"Sorry, fnramfs not installed, Dcntl(FS_MOUNT) failed"

The strange thing is, that this ramdisk IS installed, and works perfectly. Can anyone explain this?

M.Tarenskeen
(Atari Falcon030, 14MB ram, MiNT 1.15.10b, THiNG 1.27, XaAES 0.94 etc.)

This is not a feature of MagiC but of some desktops and it only works
with hard disk drivers that support the XHDI protocol, i. e. with HuSHI,
CBHD or HDDRIVER and for IDE drives I'm not even sure that all of these
drives work. (HDDRIVER does as long as the IDE drive supports IDE power
management.)
In other words, the desktop uses/requires the same mechanism like the
ACC I already mentioned.

A box with a whole bunch of ports that all looked like 'phone jacks'
and was intelligent enough to tell the user (with a speech synthesizer)
what was available at each port. If you needed to pass through more
data than usual, just use more phone jacks. Yep, phone jacks all
over the place. Just about *anybody* can figure out how to plug jacks
in. But it is very human to plug the wrong things in to the wrong
sockets, so use the speech synthesis to tell him what's wrong. Oh,
and the audio ins and outs would be through phone jacks, too.

And when it powers up properly, and is sufficiently initialized, says
something like "Computer Okay."

|over the place. Just about *anybody* can figure out how to plug
|jacks in. But it is very human to plug the wrong things in to the
|wrong sockets, so use the speech synthesis to tell him what's wrong.

And what's right. You see, that's part of the initialization
procedure. For instance, if the Box ends up saying "Waiting for
Port 1 Jack" the user knows that something is up right there.

|Oh, and the audio ins and outs would be through phone jacks, too.

Yep, phone jacks all over the place.

|And when it powers up properly, and is sufficiently initialized,
|says something like "Computer Okay."

As for speech recognition, or maybe just whistle recognition, that's
a whole 'nother ball o' wax. The manufacturer would be shooting
himself in the foot if he requires the user to input data (er, ah,
select games or applications) by whistling.

> I can't recall the last time I needed SSL, i can seem to do without...

Well u see, SSL Lynx (crapy cli app) does very good job on banking accouns, ebay payment pages etc.. My point was, how can be IConnect so superior but dont offer SSL, real local network, etherent cards supportm NFS.. to mention some? Again, i dot say its crap or bad, but dont think its something unseen...

> thousand times before....

Yes it was, and u seem not to learn anything.. There are different ways to do some tasks.. Some ppl use one way, some other.

> Lets put it this way: if someone wants to run applications the way you
> suggest, he can install MiNT and go ahead. There's absolutely no need to
> waist valuable time trying to achieve the same thing under MagiC. I can't
> imagine many MagiC users waiting for this to happen either.

I can, and i know few.. Its not strange and odd for me that ppl like Magic, and also wish some stuff from MiNT, and just to remind u, new version of Magic announced, DOES have improved MiNT compatibility..

> Just give me *one* example of a ported Unix program that runs on a 68030
> with acceptable speed, offers more features then its GEM counterpart and
> is programmed with the Atari protocols in mind... AV, DHST, BubbleGEM,
> xFSL, GEMScript, iconify etc... i call anything less second best.

I sure cant do that.. Why would Unix apps bare in mind specific Atari protocols? But believe me, i can name u a lot of Unix programs, which cooperate with GEM/TOS nicely, GEM apps can use their resources, but u can not do same on GEM only at all.. Take NFS (network file system) for

example: on same desk i have windows from Falcon and remote (TT) can
click, drag, drag n drop, whatewer between them, i can drag file from
Falcons path, on TT's QED, edit file and save it.. Can run mp music on
Falcon, simply by dragging it from TT's window to player.. Thats just ONE
example how Unix can improve GEM.. Again, there is a LOT of things in Unix
domain, Magic (or GEM only) cant even do.

> Why on earth would I need to run IFusion?
> *Most* of the STIK/STiNG clients are inferior to the IConnect clients,

> there that even comes close. Like I said: why settle for second best?

Realy? Atack FTP is great app, so is Atari IRC, both are free, what
about those nice internet games from Mario? And again, there is NO
absolute best app, someone like one, other ppl different app..

So why are u here then? I dont think this platform needs persons like u
giving such commentars... Im happy to be "idiot" who waist time on this
"gone to the dogs" platform

Janez

P.S. About CLI monster:

If u think CLI in Unix is same as go back to 800XL and typing comands,
thats your call and shows that u have "predefined fixed mind". CLI is way
from that, is way ahead of GUI for lotsa tasks. It has apps not worse,
often beter as GUI/GEM apps. Ill again give an example: Ncfp. Nice ftp
app, with aliases, fast name completion (like cli via tab key) etc, and my
personal best: when i download/upload files in CLI, or render in POVRay, i
can do what i like in AES. Change resolution, play games, music, do 90% of
crashes (xcept very fatal ones) etc.. that does NOT influence whats goinf
on in virtual consoles...

I have modified MiNT setup running on mega ST4 and yes it work, i have
2.2mb ram free, and yes its in network, and yes i can acces net via cable.
No i cant run CAB nicely.

Please explain what "u and your bunch" means... I mean i understand
sharing views and ideas, defending them, this looks like calling names. U
as Magic lower on one side and, we bunch, who use other idiotic oses on
other?

> BTW: If i feel the need to type commands i'll dust off the Atari 800...

Yeah, u realy know CLI.. and its advantages...

> Let's do a test using a very simple example:
> How many people here use ZIP.TTP ?
> How many people here use it in conjuction with a GEM-shell and why?

I use it. However the Unix version, because standard STZIP craps with
minixfs and ext2fs. The shell aint aware of NFS (well no prb for
u) etc.. It is a messy shell, u could tooke better example. But to ask u a
question: how smart u must be to type < unzip filename >

Why don't you believe in Atari users trying to get much needed software
development going? Yeah, it's a huge, ambitious project. Yeah, it in all
probability might fail. So what? It's at least a push in the right
direction. Would you rather see this kind of hopeful attitude stop, and any
kind of positive developments with it? I hate pessimism! It only tends to
make people jump ship faster.

>> I got the impression that a lot of users think that projects like this yield

> that project ended...

It ended? I never heard this. I haven't seen much of it recently, but that's
nothing new for Atari software. We're always seeing big spurts in
development, then nothing for a while. At least it's an attempt, and should
be applauded. If it is actually stopped, has anyone concidered contacting
them about releasing the source code so others can continue their work?

> Not a single month passes by without another crazy project being announced
> here, i'm always amazed seeing people fall for it. I'm already curious to see
> what project august will bring us :-/

I sure hope this is not the attitude most people here take. So what if a lot
of things don't turn out. At least there are people willing to brainstorm
and envision things for this platform. Do you want absolutely nothing to be
made anymore for the Atari? I would rather see a lot of people dreaming up
things that might not ever happen, than have absolutely nothing happen and
the final nail driven into the Atari coffin.

> This reminds me of the XTOS project early this year, we were both one of the
> few people here that called is nonsense, it's july now, the *BIG* month, the
> month is would be released, have you seen the computer for sale yet?

I read that the CPU manufacturer has postponed development, which is why
nothing has progressed the way they had hoped. They are concidering other
CPU options to speed production along. Besides, when did Atari itself ever
come out with anything on time? And they were a relatively big company
compared to these people.

>> Even if there was sufficient commercial demand (i. e. users willing to pay
>> money),
> Where would these users come from? considering that people are jumping of
> this platform by bunches, how many users will be left in 2003? I can't see
> people who are discontent with CAB holding on for another two years...

I'm very discontent with CAB, but I'm not giving up on my Falcon even though
I bought a Mac to temporarily fill this browser gap, and I'm personally
hoping for something to come of this. So I just hope people don't adopt your
fatalist attitude and give up even quicker than you say they are now.

>> would those promising to pay money still pay after one or two years?
> Of course not... one would need to ask the money upfront, but then he embarks
> on a trip which would implicate legal boobytraps...

I've been waiting a few years for the Tempest, and I would pay for it if it
ever came out and I had the money on hand at the time.

> Example: three years ago I signed up for a CT-TT from Rudolphe Czuba, I never
> got a mail from him in which he tells me that the project was vapourware, if

> i'm not interested in it anymore and would certainly not pay for it, even
> though i signed in for one...

That's your choice. Just because things take longer than expected doesn't
necessarily mean they won't happen. Even if 10% of what's announced ever
happens on this platform, I would be satisfied. Of course, if nothing is
ever announced, then we'll have 100% of it released, I guess! ;)

> Cheers from Belgium

Not very cheery, though, huh?

Interesting, I had a similar kit with a board, springs, components and project sheets. You could upgrade the entire board to a full experimental control system complete with well written manuals (even for a kid) how to build and design assorted circuits. Cool stuff. :-)
You could find them in some of the larger electronics stores but I haven't seen one in years (sigh). I don't remember the name but it came from a german company, the boxes they came in were orange with electronics and schematics on them.

These are indeed great and still made. Maplin in the UK has a few sets
upto a 200 circuit edition IIRC.

The reason is that Basic will being a good language for beginners isn't the best language to learn the art of programming (structure, modules etc..) . I'm not up to date up to date on recent Basic dialects but I believe the same problem still applies. Once you get to the higher programming languages this becomes evident and you have to 'unlearn' before you can start again.

Don't get me wrong. Basic was a good beginners language but these days I think Python is far more suited for newbies and novices.

I forgot to mention that you would have to include labor and manufacturing costs and the basic essentials (special casing (not just a standard box), cooling, cables etc...). These things eat into margins.

Educational computer toy/tool then, that's a better sales argument than most
consoles offer these days.

>

If it has a network interface you could use an external server for storage.
No need for floppy's, CD/DVD's then. You could register for this service at

the time of purchase. Maybe they could also include some open source solution for people who want to run their own server at home.

That's simply projecting the current situation into the future (and the past for that matter).

As for a cheap games machine. Remember it ain't the cheap hardware that evaporates your bankaccount, it's the software. If we're good honest corporate citizens ;-)

They WERE. Using Atari as an example is not helpful for your case, on
the contrary. After an initial impressive success hey made so many
mistakes that they failed.

What you're referring is an 'Uber-Console' given processor power, dedicated chips and proper emulators you could do that. But I'm afraid the $300 barrier would be broken if you include recent formats. For such a system to be legal (software piracy) a HD storage wouldn't be advisable. Instead it would have to support the various CD-formats, cartridge slots etc...straight out of the box.

It's possible i suppose but the price would be far above $300.

Cheers,

Thomas

I don't know about others, can only speak for myself but judging
by Uwe's posts over the past few months, dev on HD Driver could
stop at any moment. What a poor outlook, I won't sink any more money
into HD Driver, instead I'll put it towards a WebTV box.
Something I can really use!

I never have been one to dl from those free sites, but why
sink more money into such a DEAD platform? Thanks Uwe for
opening my eyes...

Hi All

Hopefully I have the problem(s) sorted now!?! The version I downloaded from Derryck's site was v1.05 Dealer only - translated into English. This does not have half the options that later versions have it seems! Thanks to Lyndon I have now got v2.11 (from 28/6/99) - this recognises the scanner straight away no messing!

The only problem I get is that when I try to scan another image after the initial one, I get a message "Scanner not ready", I have tried Resetting the scanner and re-scanning the SCSI bus (with HDDRUTIL) but to no avail. I just quit GTLook and restart it again, this could become tiresome if I was going to scan lots of individual photographs. Has anyone any suggestions?

I intend daisychaining the scanner with my other new purchase (a Yamaha CDRW 16x10x40) presumably I can still do this? I thought I read somewhere that a scanner and a CDROM drive cannot both be "live" on a chain. Presumably so long as I have terminated the last one it shouldn't matter? The CDRW is ID6, GT9500 is ID5 and the Falcon CT2B is ID7 - which one needs to be terminated?

Any help would be appreciated!

Thanks again

Neil :-))

I've tested various distro's and for the moment Suse 7.2 comes close to your ideal. The graphical setup interface is top notch. You do need a decent system to run it though, but there are plenty of other distro's for lower end systems out there. The SuSE 7.2 evaluation can be completely run from CD-ROM with some settings and some memory swap space (not necassary if you +170MB RAM) stored on your HD. This distro really is plug and play. It can detect most of the components (sound, network, video, modem etc..) and set them up correctly. If your card isn't detected automatically you just select it from the list. (I had to select my old SB16 ISA card this way) and just fill in the settings for FM, MIDI, IRQ that sort of thing.

In the end you get a perfect configured Linux system thats idiot proof. No hassle, no danger of messing up your HD. Just boot the CD for a test run. Try downloading a version to see for yourself from www.suse.com

I've been experimenting with Linux for two years now and SuSE 7.2 (and Mandrake?) is the best idiot proof version I've seen. Anyone reading should try it, it's that good.

Cheers,

Thomas

1678. PC Word format for Papyrus?

Newsgroup: comp.sys.atari.st
Date: 2001-07-13 23:16:25 UTC
From: cstanley@zetnet.co.uk
Message-ID: <3b4f8149$0$24130@news.zetnet.co.uk>
Source record: 43750

Hi All!

(Faithful Atari TT[*] user: MagiC6, NVDI5 etc etc.)

This is a request for suggestions I might send to someone who sends out Word-something docs to a number of colleagues who may or may not have a PC or a compatible WP app.

I use Papyrus8, which usually has no difficulty with PC Word docs. Tonight however, I received a doc that could only be opened as ASCII "for lack of (as Papyrus noted) sufficient parameters": it equated to 120 pages but was only TWO pages in result, after deleting the rest, which contained sheer guff, gunge and other cr*p.

Even then, it didn't make sense, so I binned it utterly and will have to request hardcopy instead, as I already have done before.
She-who-must-be-listened-to doesn't agree, of course.

Charles.

* TT: yes, friends, my Hades has sickened and died. It doesn't even know it has a drive A. Paint drying is faster than its memory check.

Maybe some are just realistic. Others are simply too naive, with the
result of being disappointed again and again as soon as another project
they believed in (even if it was not realistic) finally dies. It is
requires that the users do not simply believe any claim about a new
project but also analyse whether it makes sense at all.
In my opinion efforts are wasted on certain projects that most likely
cannot succeed, whereas other projects that have a better chance to
succeed are not continued anymore.

Is there an NTSC version of the vidi-st software? I have two of the video capture boxes and the original disks for both but the filenames seem to indicate pal versions despite an NTSC marking on the label. When I try to use either one the picture rolls (loss of vertical hold) and the picture is shifted to the left which would indicate the vertical and horlzongal sync pulses aren't being handled properly.

1692. [PUB]: New on the Belgian ftp-server

Newsgroup: comp.sys.atari.st
Date: 2001-07-14 08:50:10 UTC
From: "Martin \"Nightowl\" Byttebier" <tos4ever@pandora.be>
Message-ID: <3b50157e17442f2@pandora.be>
Source record: 43766
Cross-posted to: comp.sys.atari.st,fr.comp.sys.atari

```
New at the Belgian ftp-site chapelie.rma.ac.be
------------------------------------------------------------

**********************************************************
* If a package would be corrupt, please contact *
* *
* tos4ever@pandora.be *
* or *
* saka@village.uunet.be *
* *
* so they can delete it and put a good version here *
* *
* Only with your cooperation this site can become good *
**********************************************************

**archivers**
ftp://chapelie.rma.ac.be/atari/archivers/zip23_02.zip (148.111 bytes)

ftp://chapelie.rma.ac.be/atari/archivers/zippat04.zip (5.082 bytes)
(This patch is for the Atari port of "zip 2.0". This archiver is well
accepted because it supports long filenames (unlike the old ST-ZIP).

**game**
ftp://chapelie.rma.ac.be/atari/game/pdamaze.zip (147.481 bytes)
(PDAMaze is a simple litle maze game using pre rendered graphics
for speed.)

**midi**
ftp://chapelie.rma.ac.be/atari/midi/midifp30.zip (404.296 bytes)
(The MIDI File Printer prints a new easy-to-read musical notation.
It expects standard MIDI files as input and prints via GDOS/NVDI.)

ftp://chapelie.rma.ac.be/atari/midi/midihc20.zip (156.351 bytes)
(The MIDI Enhancer allows you to play microtonal music on
conventional synthesizers supporting the MIDI poly mode
(multi mode) and on GS compatible MIDI instruments.)

**mint**
ftp://chapelie.rma.ac.be/atari/mint/net/rtl8012x.zip (3.326 bytes)
(This is the driver for pocket adapters using the RTL8012 chip from
RealTek. It can be used with the ROM to parallel port interface,
now developed by Elmar Hilgart.)

**multitasking**
ftp://chapelie.rma.ac.be/atari/multitasking/MagiC/mgpatch0.zip (4.455 bytes)
(patch for MGVIEW)
```

network
ftp://chapelie.rma.ac.be/atari/network/other/magic-net/drac_emu.zip (14.615 bytes)
(draconis-to-MagiCNet gateway)

ftp://chapelie.rma.ac.be/atari/network/other/magic-net/gluestik.zip (18.269 bytes)
(GlueSTiK - STiK to MagiCNet gateway)

ftp://chapelie.rma.ac.be/atari/network/other/magic-net/magxnet.zip (230.759 bytes)
(MiNT-net port for MagiC)

ftp://chapelie.rma.ac.be/atari/network/other/magic-net/smb_cnt.zip (101.052 bytes)
(SAMBA client for MagiCNet
This is the port of SMB client, the client that gives access to
SMB compatible (NetBIOS) servers such as several Unix systems,
Linux, windows(95/98/2k) and win-NT. Drives, folders, files and
printers 'exported' by the server can be accessed by the client.)

ftp://chapelie.rma.ac.be/atari/network/other/bnets303.zip (37.729 bytes)
(BNET networks for MagiCNet (MiNT-net server only)

ftp://chapelie.rma.ac.be/atari/network/servers/ftp_serv-109.zip (43.234 bytes)
(FTP Server is a program that lets users to connect to a
central computer (called the server) and share files.)

utilities
ftp://chapelie.rma.ac.be/atari/utilities/music/abcm2ps-252.lzh (190.280 bytes)
(abcm2ps is a program which converts music tunes
from ABC format to PostScript.)

That's waht I did now, soldering from the top of the board. I even only desoldered one side of the resistor (Pin3), bent it over to Pin1, and soldered it there as the resistors are supposedly zero-ohm.

And it actually works fine, my 1040STE has now 2.06!! The desktop is already cluttered with icons and uses the same keyboard shortcuts I use in BeOS...sweet :-))

Thanks to ya all!

Ove

1694. Re: ICD Host adapter problem?

I can only second that as I am using two Quantum SCSI drives with a 1040STE and a MegaSTE without problems. I have an ICD "The Link" Adapter, think it's the Link II.

One of the Quamtums is model 270LPS and taken from an Apple Mac computer. It is terminated with the built-in resistors. If I remember right, the only thing I had to change was to jumper the drive so it will auto-spin-up instead of waiting for a signal from the hostadapter. Also the parity mode worths to be checked. You can still find all the tech support info (like jumper settings) for these old drives on Quantums website!

Other than the harddrive, which ICD driver software version are you using, Don? I have 6.08 here and it seems to work fine (although I believe there is a newer version on ICD's website).

IMO you shouldn't give up on the drive, Don.
There must be a setting to get it to use.

Ove

>from Derryck's site was v1.05 Dealer only - translated into English. This
>does not have half the options that later versions have it seems! Thanks

OK, I don't have a clue about this driver as it was provided by Bob King.
Thanks for the feedback.

>I intend daisychaining the scanner with my other new purchase (a Yamaha
>CDRW 16x10x40) presumably I can still do this? I thought I read somewhere
>that a scanner and a CDROM drive cannot both be "live" on a chain.

That's not true. Use the usual rules about different IDs for each device,
and only terminate the last (physical!) device in the chain. I don't know if
your CDRW is specifically supported by any of the CD writer software, but
that's not the issue as far as your question goes.

No, it doesn't... As mentioned previously, BBC BASIC had procedure and function definition... QL SUPERBASIC went one further and the procedures/functions actually defined new keywords... It also had Repeat loops and such. It was quite possible to dispense with GOTO altogether. (And this was in 1983)

Hell, even C has GOTO... It's just that its use is frowned upon to the point of flogging.

Besides that, a computer without a ROM is just a dead hunk of silicon.
Fine, the CPU will work, the memory will work, but without a little peice of
code in ROM to tell it what to do at power on, where does it get the
instructions to deal with the network or hard drive?

Does this person think the hard drive just automatically squirts data into
the CPU without any instructions from the CPU whatsoever?

Source record: 43816

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Thu, 12 Jul 2001 18:17:39 GMT

Hi Frederic,

>You are correct, magic should NOT have any command line, and ANY ttp.
>We'll make sure that next version can not run any of those.
Fine, this will be a blessing. Have you asked yourself the question how
many MagiC users are waiting on this kind of nonsense to start with?
BTW: where have I mentioned the words "command line" or "TTP" ?

>That would be too lame, especially that you can install linux or netbsd on
>your atari1040 STE.
Yes, it certainly would be lame, mind you... i would *love* to see your MiNT
and MinTNet setup run on a 1040STE.... that would be *really* cool.

>Correct again, command line should ONLY be available on MiNT and linux,
>but NOT MagiC,
Since you are obviously obsessed by command lines: IMO these are monsters
from way back in the seventies and don't belong in this century anymore. One
of the reasons I bought an Atari was because of GEM, if you and your bunch
want to spend your time porting stuff then at least go through the trouble
of adding a decent user interface. You may think that a command line is a
gods gift, but i'm convinced that the majority of the people here think
different...
BTW: If i feel the need to type commands i'll dust off the Atari 800...

>I hope Dennis that ash/Andreas are listening to you, so they'll make sure
>no one can run any command line, as it is totally against the whole
>purpose of the GEM.
They don't have to, ASH listens to their customers and know what they like
and dislike. That's the secret of staying in business. Does your bunch ever
listen to the users or have you lost touch with the real world completely?

Let's do a test using a very simple example:
How many people here use ZIP.TTP ?
How many people here use it in conjuction with a GEM-shell and why?

Cheers from Belgium
Dennis

>Tell me, how SSL runs with Icconect?
It doesn't, just like it doesn't with STiK or STiNG.... if i need to
visit an SSL secured site i'll use a PC or Mac, condering most of these
sites use JavaScript they aren't accessible with CAB anyway...
I can't recall the last time I needed SSL, i can seem to do without...

>Nad why not instaling MiNT and runing UNIX *CRAP* and GEM *CRAP* at
>same time?
I was commenting about MagiC possibly running Unix crap, i never mentioned
MiNT, and i'm not going to either.... this discussion has been been held a
thousand times before....
Lets put it this way: if someone wants to run applications the way you
suggest, he can install MiNT and go ahead. There's absolutely no need to
waist valuable time trying to achieve the same thing under MagiC. I can't
imagine many MagiC users waiting for this to happen either.

>And why wouldnt GEM *CRAP* use UNIX *CRAP* resources? Why settle for
>second best?
Just give me *one* example of a ported Unix program that runs on a 68030
with acceptable speed, offers more features then its GEM counterpart and
is programmed with the Atari protocols in mind... AV, DHST, BubbleGEM,
xFSL, GEMScript, iconify etc... i call anything less second best.

>Please give me a break! Iconnect? U must BUY Ifusion to run FREE Stik
>APPs..
Why on earth would I need to run IFusion?
Most of the STIK/STiNG clients are inferior to the IConnect clients,
prove me wrong if you like... IMO except for Okami there is nothing out
there that even comes close. Like I said: why settle for second best?

To stay on topic:
It should be clear by now that the developers of commercial software are
running away from this platform like crazy, who can blame them? what kind
of idiot is going to waist valuable time on a platform where 750 copies
sold is a huge success? Support free software by all means but don't come
complaining when there's no commercial alternative available anymore, even
now, occasionally someone pops up here wanting to know how to set up the
demo version of CAB with STIK/STiNG, people aren't even prepared to pay for
CAB anymore... this platform has really gone to the dogs!

Cheers from Belgium
Dennis

In fact, fnramfs.xfs will crash MiNT during boot on my Falcon/AB under
1.15.10 or newer. So not only do you not need it, you *must* remove it as
it seems to cause some sort of conflict that might affect the stability of
your system.

Hi Martin,

>>BTW: The poll forgot to ask on which stack(s) the browser should run and
>>even more important why... this is food for another very long thread ;-)
>
>Definitely not on Iconnect. This is not a standard at all.
OK, that's one opinion... but I recall that MiNTNET clients need their own appropriate OS and stack as well, so they can't be considered as a standard either...

Here's food for another very long thread ;-)
Before that new super duper browser is developed, shouldn't a new stack be developed first? one that is capable of running under MagiC and MinTNET is easy to install and geared towards the future ie. is capable of handling basic standard protocols like SLIP, PAP, CHAP, POPoEthernet, static and dynamic DHCP, ISDN, ADSL... etc
Once that stack is finished, we're ready to discuss the clients which obviously need to be written for it, but then that's food once again for another very long thread.

I think it's going to be a very long and hot summer in CSAST:-)

Cheers from Belgium

Hi Mike,

>Why don't you believe in Atari users trying to get much needed software
>development going?
Let's just say that i'm the realistic type...

>Yeah, it's a huge, ambitious project. Yeah, it in all probability might
>fail. So what? It's at least a push in the right direction.
I can't see how a project failing is a push in the right direction, the only push is that people will be left with a nasty taste in their mouth and leave this platform even faster...

>Would you rather see this kind of hopeful attitude stop, and any kind of
>positive developments with it? I hate pessimism! It only tends to make
>people jump ship faster.
Of course not, if a project is announced which I think has a realistic chance to make it, i'll give it my full support. Pessimism doesn't have anything to to with this. IMO that proposed new browser will never happen, if it ever appears I'll be the first one to admitt i was wrong. I do have the right to have a opinion? sorry if it goes against the general mainstream

>>The latest attempt to produce a "better" browser then CAB was Adamas Pro,
>>we know how hat project ended...
>
>It ended? I never heard this. I haven't seen much of it recently, but
>that's nothing new for Atari software
Well then the problem is solved.... go and support Adamas Pro. Don't count on me though... and before you say i'm showing a negative attitude chew on this: i've bought and supported Draconis from day one, after several updates and lots of promises it still doesn't deliver what was promised. I'm fed up putting money in projects like these!! the author even had the cheek to blow all the problems of his bug ridden masterpiece from the table and blame it on the user. Bugs that can be repeated are commented as "this is not a bug but a feature...". Adamas Pro has been tested by 100 betatesters, I wonder who these people are and what exactly they've been testing...
And yes, I know you can surf the net with Adamas, the reason I bought it was because of the JavaScript module... it doesn' work at all, it never has and it'll be a miracle if it ever does... again that's my personal opinion and if it will ever work, so much the better for the Atari community. I'll be the first one to applaude, but until then i call it a "dead horse".

>>Not a single month passes by without another crazy project being announced
>>here, i'm always amazed seeing people fall for it. I'm already curious to

>>see what project august will bring us :-/
>
>I sure hope this is not the attitude most people here take. So what if a
>lot of things don't turn out. At least there are people willing to
>brainstorm and envision things for this platform.
These people are dreamers.... the Milan, Hades, Romport ethernet adapter, several graphic cards and a zillion other things were never discussed in the open. Developers don't need brainstorming from users and certainly not their vision. All that's required is people go and buy the products. Unfortunately that doesn't happen... everyone agreed that the Milan and Hades are great machines and continued the Atari tradition. Both these computers are still for sale, nobody wants them... because they are waiting on vapourware to vaporize... that's the result of the attitude you don't like. In the mean time we're demanding applications which could probably run on the Hades and Milan...

>Do you want absolutely nothing to be made anymore for the Atari? I would
>rather see a lot of people dreaming up things that might not ever happen,
>than have absolutely nothing happen and the final nail driven into the
>Atari coffin.
People dreaming up things for other dreamers... and you want me to support this?
The people that actually produced things for the Atari aren't dreamers at all, they tend to be very realistic people with a vision and business sense. If there's a market, they'll produce it, dreamers tend to dream on, that's not the kind of customers they have in mind.

>>This reminds me of the XTOS project early this year, we were both one of
>>the few people here that called is nonsense, it's july now, the *BIG*
>>month, the month is would be released, have you seen the computer for sale
>>yet?
>
>I read that the CPU manufacturer has postponed development, which is why
>nothing has progressed the way they had hoped.
Someone announced a computer running on a CPU that doesn't even exists, me and some other people here with a realistic view said the proposed project is pure nonsense and we get buckets full of shit poured over our heads for being negative... these kind of annoucements make people jump ship, they give people false hope.

>Besides, when did Atari itself ever come out with anything on time? And
>they were a relatively big company compared to these people.
The MegaST and 1040STE were right on time. The MegaSTE even came as a total surprise. Atari made a lot of mistakes, but they never announced a computer with a non-existing CPU.

>I'm very discontent with CAB, but I'm not giving up on my Falcon even
>though I bought a Mac to temporarily fill this browser gap,
Personally I'm very happy using CAB, it does everything it promises to do unlike Adamas Pro who promise things which aren't even implemented. CAB is perfectly suited for the Atari platform. Implement more features and you

need a faster computer...
The same applies for that proposed new browser, if you want a speedy browser with lots of features then forget running it on vintage Atari's. You'll probably reply now telling me that by the time the browser is ready, we're all going to have a Tempest or CT-60 installed? two more vapourware projects that have been discussed here....

>If it is actually stopped, has anyone concidered contacting them about
>releasing the source code so others can continue their work?
Here we go again... who are these "others"? who are these talented people which obviously are hiding under a rock? take a deep breath and take a good look around.. the programmers *capable* of such a venture are gone and they will not come back.

>> Cheers from Belgium
>
>Not very cheery, though, huh?
on the contrary...
I'm happy with what I've got. I *know* the limitations of my computer and don't dream about impossible things. I've come to the stage were I don't expect anything anymore, if something does fall out of the woodwork then I'm pleasantly surprised i.e the soon to be released MagiC 6.2...

Cheers (once again) from Belgium
Dennis

You talk about the compiled TOS-Images, right? For use in emulators,
not the source of TOS, right?

Some source of GEMDOS from the LISAs OS are GPLed and available on my
site at:

http://www.mucl.de/~mdoering/atari/en/

I'm in the process to rebuild GEMDOS (at first without GEM) from these
sources for to use it on the STonX emulator.

Yes it's wrong, but I'm only refering to HD Driver.
You got my initial money for version 7 something but I
won't sink no more $ into it. It is your outlook that I am specifically
unhappy with, especially from someone trying to sell a product.
Frankly I don't know why you bother.
Don't like my way of thinking? Fine we are even on that.. life goes on.

Hello Lyndon Amsdon !

> Are you sure you want v3? It got to something like version 6.1.
> Lyndon Amsdon

Yes, I'm really sure ...
It's for an old ATARI 1040 STF with a SH205 (20 Mo) hard disk ...

I've got AHDI 5.00 and 6.1, and don't works very well with these old stuff
:-)

Thank you for your answer :-)

If the Hades had a lower price tag everybody and their brother would
have one. I don't get the "specific apps" for these machines arguement.
It's a price issue, always has been. You hit the right price and it
would not matter what apps are out there it would sell. A hades makes
CAB fly, I've no speed complaints with CAB. Maybe a browser with
proper Javascript would run better on a Hades, but I've seen it
done on a 030 Amiga. If that slow thing can do it there is no
reason why an 030 Atari can't. Could someone please tell me
what these specific apps for Hades and Milan are that never appear?

Don't reply with games... a cheap ST or PlayStation is a better
option there.

On behalf of a customer I have a full Falcon Mk X Cubase Audio Falcon
package for sale.
List.
C-Lab Falcon Mk X, 2 gig internal, 1 gig external SCSI.
Cubase Audio Falcon software.
17" Digital monitor.
Soundpool F A 8 expander.
Steinberg SMP 2 SMPTE, midi expander.
Falcon Digital Interface.
Cubase Audio Clock module.

This is a full working package, my customer will not split it unless most or
all of the items are sold.
Email sensible offers in the next 14 days for some or all of it.

Barrie at Keychange Music.

1712. Re: GT9500 Scanner not initialising?

Newsgroup: comp.sys.atari.st
Date: 2001-07-14 16:36:00 UTC
From: Peter_Schneider@su2.maus.de

Source record: 43794

Hi Neil,

NC>Thanks to Lyndon I have now got v2.11 (from 28/6/99) - this recognises
NC>the scanner straight away no messing!
congratulations! For I find it hard to look for mistakes if a
modern scanner is concerned...

NC>The only problem I get is that when I try to scan another image after
NC>the initial one, I get a message "Scanner not ready",
I suppose you did wait until the scanner returned into its 'home
position'? I may stop my whole system if I'm not patient...

NC>I intend daisychaining the scanner with my other new purchase (a
NC>Yamaha CDRW 16x10x40) presumably I can still do this?
So did I after I bought my Yamaha CDRW 8424.

NC>I thought I read somewhere that a scanner and a CDROM drive cannot
NC>both be "live" on a chain.
Usually, here both are switched off. No problem at all, besides I have
to reset the SCSI bus due to the effects Derryck described earlier
this thread.

NC>The CDRW is ID6, GT9500 is ID5 and the Falcon CT2B is ID7 - which one
NC>needs to be terminated?
The first and the last SCSI device. For me it's: Internal disk yes, TT
no, three external no, the scanner as the last yes.

You see: Even the scanner being switched off, but being terminated,
the chain runs perfectly. And at least one device _must_ supply
TermPower to the bus.

Und TTschï¿½
ps
